

Publications Reissue Highlights

Manual: *ACI Java Server Framework Reference Guide*

Number: CF-DA000-02-ES

Date: Dec-2006

Software: Release 1.0 Version 06.4

The following table highlights the major changes that have been made in the most recent update to the *ACI Java Server Framework Reference Guide*. The first column of the table lists the sections and appendixes in which major changes have been made. The second column of the table describes the major changes for each section or appendix. These changes update the guide from release 1.0, version 06.2 to release 1.0, version 06.4.

Section/ Appendix	Major Changes
All	Adds “(Java)” to references to ATM (Java) Device Handler processes to differentiate them from C++ ATM Device Handler components.
1	Updates the description of the Configuration and Instrumentation subsystem to include the masking of sensitive data displayed on JSF-based ACI desktop windows or browser pages for Payment Card Industry (PCI) compliance. Adds notes for third-party Java Archive (JAR) files not provided by ACI.
2	Updates the “Code Generator” topic to indicate the type of metadata (.gen or *Gen.xml) text files used as input to the code generator and to indicate that database service names used in the db.audited.db-service-name and db.cached.db-service-name properties must match the names defined for the database services. Adds the FieldMasking.xml file to the Configuration and Instrumentation Subsystem topic. Adds a recommendation to the “Properties Files” topic that all configuration properties be defined in the Application Configuration data source (APPLCNFG). Only those properties required to bootstrap the Java process need to be configured in the config.properties file.
3	Adds a recommendation to the “Application Configuration” topic that all configuration properties be defined in the Application Configuration data source (APPLCNFG). Only those properties required to bootstrap the Java process need to be configured in the config.properties file. Clarifies how Java processes search the APPLCNFG for process-specific property values before searching for wildcarded property values.

Section/ Appendix	Major Changes
----------------------	---------------

- | | |
|---|--|
| 3 | Clarifies the description of the PATHSEND protocol to indicate that it requires the configuration of a Pathmon PPD, Pathway server class, and symbolic destination name. It also allows for configuration of the MDSHDR option rather than no options. |
| 4 | <p>Updates the “Cache Administration” topic with the names of properties used to configure automatic cache cleanup.</p> <p>Clarifies that JSF-based application event messages are identified with subsystem IDs above 3499.</p> <p>Adds a “Field Masking” topic that explains how to configure masks in the FieldMasking.xml file to mask the display of sensitive data in JSF-based applications for Payment Card Industry (PCI) compliance.</p> |
| 5 | <p>Adds a description of the GetAllMask system property.</p> <p>Updates or adds descriptions of the following properties to support the masking of sensitive data in JSF-based applications for Payment Card Industry (PCI) compliance: xmlmaskmap.filename and xmltranmap.filename.<i>n</i>.</p> <p>Clarifies the descriptions of the db.audit.db-service name, db.audited, and db.audited.db-service-name properties to indicate that they control the auditing of all database service activity whether it be from an automated timer task, ACI desktop user interface, or other database service use.</p> <p>Corrects the database service names for generic JSF data sources in the db.audited.db-service-name property description.</p> <p>Adds a description of the db.useisolationlevel property.</p> |
| A | <p>Adds a description of the jsf.pci.masking.jaxb.context property to support Payment Card Industry (PCI) field masking for the ACI desktop user interface.</p> <p>Changes several database service names used in the names of the db.audited.db-service-name and db.cached.db-service-name properties to match the database service names used by the ATM (Java) Device Handler and IFX ATM Manager processes. Adds database service names used by the C++ ATM Diebold and NCR Device Handler components.</p> <p>Updates the description of the db.cached.db-service-name property to indicate that ACI recommends that caching be enabled for several USEC data sources for efficient processing of the View > User Permissions and View > User Status reporting functions.</p> <p>Adds and updates descriptions of properties for automatic generation of the User Detail and User Permissions XML reports, respectively.</p> |

Section/ Appendix	Major Changes
B	Corrects some of the database service names listed in the <code>db.cached.db-service-name</code> property description.
