

Publications Reissue Highlights

Manual: *ACI Java Infrastructure Java Server Reference Guide*

Number: CF-DA000-02-ES

Date: Sep-2009

Software: Release 1.0, Version 09.2

The following table highlights the major changes that have been made in the most recent update to the *ACI Java Infrastructure Java Server Reference Guide*. The guide has renamed from *ACI Java Server Framework Reference Guide* to *ACI Java Infrastructure Java Server Reference Guide* to better describe its contents. The guide now includes information on the AJPF and AJMF in addition to the AJSF. The first column of the table lists the sections and appendixes in which major changes have been made. The second column of the table describes the major changes. These changes update the manual to release 1.0, version 09.2.

Section/ Appendix	Major Changes
5, A	Moves properties specific to user security and user auditing from Appendix A to section 5 because they are part of AJSF. Renames the <code>db.audited.db-service-name</code> and <code>db.cached.db-service-name</code> properties to <code>db.audited.table-name</code> and <code>db.cached.table-name</code> , respectively. These properties must be named according to the physical table name they relate to rather than according to the name of the database service that accesses the table.
1	Adds introductory material for the ACI Java Infrastructure (AJI) and the ACI Java Presentation Framework (AJPF). Updates the list of third-party JARs used by the AJSF. (Per list provided by Greg Barry).
2	Adds a note to the “Auditing User Actions” topic to indicate that <code>ajmf.audited.function</code> properties determine whether user functions performed through ACIJMX agents are audited.
4	Adds quick reference tables for configuring protocol configuration options on the External Connections Configuration window for each supported protocol. Adds configuration requirements to support the SMTP protocol. Renames ES-MQJMS to MQJMS for generic packaging of the ACI Event Adapter.

- 4 Updates the Tomcat version in all coding examples to 6.0 and adds a note to indicate that Tomcat version 5.5 is required for the HP NonStop s-series platform while Tomcat version 6.0 is required for the HP NonStop Integrity, IBM system z and Unix platforms.
- Adds a new topic called “Clustered Configurations” for configuring multiple AJI-based application processes on one server or across multiple servers. AJI clustering enables AJI process that use the same database to keep cached data in synchronization.
- 5 Adds a reference to the *ACI Java Infrastructure ACI Application Management User Guide* for properties specific to the AJMF.
- Updates the description of the file.encoding system property to indicate that it must be set to the value of the MULTIBYTE_ENCODING property to support multibyte encoding.
- Updates the description of the ConfigPropertyBuilder password encryption utility to indicate that once the passwords are encrypted in the config.properties file, you must stop and restart the AJI application (e.g., ESWEB process) that uses the config.properties file.
- Adds a note to the description of the ConfigPropertyBuilder password encryption utility to indicate that if you change the value of the db.user.password property, you must also update the value of the *db-user-id_UID* parameter in the CONFCSV (or config.csv), where *db-user-id* is the database connection user ID value.
- Removes the description of the db.audit.db-service-name property because it is not longer supported in this version.
- Updates the description of the db.audited property to indicate that a value of true means that all database table activity is fully audited, except for any configured db.audited.table-name properties that are set to a value of medium or none. A value of false for the db.audited property indicates that no database service activity is audited, except for any those db.audited.table-name properties that are set to a value of full or medium.
- Updates the list of database tables generic to the AJSF database in the db.audited.table-name property to indicate that the *table-name* must match the physical table name in the AJSF database. Adds additional database table names for generic AJSF data sources.

Section/ Appendix	Major Changes
----------------------	---------------

-
- | | |
|---|---|
| 5 | <p>Adds a note to the description of the <code>db.user.id</code> property to indicate that the value of the <code>db.user.id</code> property for the BASE24-eps User Interface (ESWEB) server must match the <i>db-user-id</i> name portion of the <i>db-user-id_UID</i> parameter in the CONFCSV (or <code>config.csv</code>), where <i>db-user-id</i> is the database connection user ID value.</p> <p>Adds a note to the description of the <code>db.user.password</code> property to indicate that the value of the <code>db.user.password</code> property for the BASE24-eps User Interface (ESWEB) server must match the value of the <i>db-user-id_UID</i> parameter in the CONFCSV (or <code>config.csv</code>), where <i>db-user-id</i> is the database connection user ID value. Thus, when you change the database connection user ID password, you must change it in both places.</p> <p>Updates the descriptions of all <code>.starttime</code> properties to indicate that start times are automatically adjusted for daylight savings time (summer time). The default values for several <code>.starttime</code> properties have also changed.</p> <p>Adds a description of the <code>MULTIBYTE_ENCODING</code> property.</p> <p>Adds a description of the <code>user.security.AllowFilterMigration</code> property and updates the <code>user.security.version</code> property to indicate that existing field filters for permission IDs are automatically migrated to each user associated with the permission ID when the ESWEB process is started, the <code>user.security.AllowFilterMigration</code> property is set to true, and the <code>user.security.version</code> property is set to <code>usec1.2</code>.</p> <p>Removes the <code>usec1.1</code> value from the <code>user.security.version</code> property since it is no longer supported in 09.2.</p> |
| 7 | <p>Comments out the <code>SYSOUT</code> appender in the example <code>EventConfig.xml</code> file and adds a note to indicate that ACI recommends that the <code>SYSOUT</code> appender not be used to avoid the unnecessary duplication of events from the <code>ACIJMX</code> agent in the Event Log data source (<code>EVNTLOG</code>).</p> <p>Removes “base24.es.” from all class names that begin with “com.aciworldwide.base24.es.event” for generic packaging of the ACI Event Adapter.</p> |
| 8 | <p>Adds a new section to describe the ACI Java Presentation Framework (AJPF).</p> |
| 9 | <p>Adds a new section to describe initialization maps.</p> |

Section/ Appendix	Major Changes
----------------------	---------------

-
- | | |
|---|---|
| A | <p>Moves properties specific to user security and user auditing from Appendix A to section 5 because they are part of AJSF.</p> <p>Updates the description of the <code>db.char.set.ebcdic</code> property to indicate that it is used in conjunction with the <code>CCSID_VARIANTS</code> Environment attribute to define the IBM Coded Character Set Identifier (CCSID) variants supported by ATM Device Handler components.</p> <p>Updates the list of database tables in the description of the <code>db.audited.db-service-name</code> property for database tables added in the version 09.2.</p> <p>Adds properties to support the Voice Authorization application and associated web browser pages.</p> |
