

## Publications Reissue Highlights

**Manual:** *BASE24 Transaction Security Services Processing Guide*

**Number:** BA-AE000-14

**Date:** 02/2004

**Software:** Release 6.0, Version 4 (TSS Release 04.1)

The following table highlights the major changes that have been made in the most recent update to the *BASE24 Transaction Security Services Processing Guide*. The first column of the table lists the sections and appendixes in which major changes have been made. The second column of the table describes the major changes for each section or appendix. These changes update the guide to TSS release 04.1 for release 6.0, version 4.

| Section/<br>Appendix | Major Changes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| All                  | The Node Controller application is no longer required for the ACI Desktop user interface. References to the Node Controller application have been removed from throughout the guide.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 1                    | <p>Adds support for derived unique key per transaction (DUKPT) PIN processing and message authentication for the BASE24-pos Standard POS Device Handler (SPDH).</p> <p>Adds a discussion of how task IDs relate to ACI Desktop user interface windows for setting up user security access. For windows that retrieve a list of values for a field from another window, you must at least give a user view access to the window from which the list of values are retrieved. In addition, some windows that are based on a channel or interface framework, also require access to the task ID of the server component for the framework.</p> <p>Removes the list of permission IDs and associated task IDs needed to access ACI Desktop user interface windows because this information is now provided in the <i>ACI Desktop Manual</i> and the ACI Desktop online help.</p> |

- |   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2 | <p>Adds support for the DUKPT Derivation Key Profile Configuration window.</p> <p>Adds a discussion of the new Key Index field added to the EMV tab of the Authentication Profile Configuration window.</p> <p>Adds a discussion of the TSS Index token to the Interac Key Management tab of the BASE24 KEYF Configuration window.</p> <p>Corrects the Atalla variant constants described for variants 1 and 2 under the “Key Variant Fields” topic. They should be 0800 0000 0000 0000 and 1000 0000 0000 0000, respectively.</p>                                         |
| 3 | <p>Adds the PIN_LGTH_ERR_RETRY_IND environment attribute. This attribute determines whether the Transaction Security Services component retries an HSM operation using the previous key from the Channel Security Configuration File (CSECD) when the HSM returns a sanity check error or PIN length error.</p>                                                                                                                                                                                                                                                            |
| 4 | <p>Adds Atalla premium option 8C (Allow a replicated single length Visa PVV PIN verification key). This option must be enabled for the Verify PIN—Visa PVV Method (32#3) and PIN Change—Visa PVV (37#3) commands to allow single-length Visa PVV keys to be replicated in triple DES operations.</p> <p>Adds the Atalla and Thales e-Security hardware security module commands and options needed to support DUKPT encryption and message authentication.</p> <p>Adds a description of the ISO format 1 PIN block, which can now be used with Thales e-Security HSMs.</p> |
| 9 | <p>Adds the syntax for the Trace Header command. This command allows you to enable or disable headers in trace output records.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| A | <p>Adds the conversion program for the Derivation Key File (KEYD).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Section/<br>Appendix | Major Changes |
|----------------------|---------------|
|----------------------|---------------|

|   |                                                                                           |
|---|-------------------------------------------------------------------------------------------|
| B | Adds lists of the protocols supported by AKDS for Diebold 10XX/478X and NCR 5XXX devices. |
|---|-------------------------------------------------------------------------------------------|

Corrects the procedure for contacting NCR to start the process of submitting a public key and getting it signed by NCR. You should contact your NCR/Reseller Account Manager rather than contacting NCR Customer and Sales Support directly.

Clarifies AKDS procedures for NCR. The root NCR public key you enter on the Certificate Management window must be self-signed. The root NCR public key is referred to as the Global NCR public verification key in NCR documentation. Your initial NCR contact for getting your BASE24 system public key signed is your NCR/Reseller Account Manager. The account manager will then establish your name, mailing address, e-mail address, telephone and fax numbers and advise NCR Customer and Sales Support to send you the appropriate documentation. A table mapping the values returned from NCR to the appropriate fields on the Certificate Management window has been added.

|   |                                                                                                                                                             |
|---|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| C | Adds the Derivation Key File (DRVKD) to the Check Digits Validation and Generation utility, AKB Conversion utility, and Master File Key Conversion utility. |
|---|-------------------------------------------------------------------------------------------------------------------------------------------------------------|

Adds a prerequisite to the AKB Conversion utility for premium option 8C. This option must be enabled for the Verify PIN—Visa PVV Method (32#3) and PIN Change—Visa PVV (37#3) commands to allow single-length Visa PVV keys to be replicated in triple DES operations.

Clarifies the use of the AKB\_CNV\_DES\_3DES\_HDR attribute for the AKB Conversion utility. This attribute is optional. If you do not enter this attribute, it defaults to a value of “1KDDN0M0”.

Adds a conversion option for DUKPT derivation keys to the Master File Key Conversion window.
