

Publications Reissue Highlights

Manual: *BASE24 Transaction Security Manual*

Number: BA-AE000-13

Date: 11/2003

Software: Release 6.0, Version 4

The following table highlights the major changes that have been made in the most recent update to the *BASE24 Transaction Security Manual*. The first column of the table lists the sections and appendixes in which major changes have been made. The second column of the table describes the major changes for each section or appendix. These changes update the manual to release 6.0, version 4.

Section/ Appendix	Major Changes
2	Updates the “DUKPT PIN Block” topic for Transaction Security Services process support of derived unique key per transaction (DUKPT) PIN encryption (available in a future release of TSS), KSN validation performed by the SPDH module, and DUKPT message authentication (available in a future release of TSS). Adds procedures for changing the terminal security module (TSM), or PIN pad, in an SPDH-compliant terminal using the DUKPT method of PIN encryption.
4	Adds support for Transaction Security Services process support of derived unique key per transaction (DUKPT) PIN encryption (available in a future release of TSS). Adds descriptions of new LCONF params used by the SPDH module for validation of the KSN and counter received in transaction requests from an SPDH-compliant terminal using the DUKPT method of PIN encryption.
5	Adds a note for derived unique key per transaction (DUKPT) message authentication. DUKPT message authentication uses a derivation key instead of a MAC key and also includes the key serial number (KSN), length of the KSN, and KSN key descriptor as input for computing the MAC. DUKPT message authentication is only available when using the Transaction Security Services process (available in a future release of TSS).
7	Adds configuration support of DUKPT message authentication by the SPDH module. DUKPT message authentication is only available when using the Transaction Security Services process (available in a future release of TSS).

Section/ Appendix	Major Changes
----------------------	---------------

-
- | | |
|----|---|
| 8 | Updates the description of the ORIGINATOR field in the BASE24-pos Standard Internal Message (PSTM) to indicate that it only applies to the DUKPT encryption method and Thales e-Security host security modules when the Transaction Security Services process is not used. |
| 15 | Adds a note to indicate that BASE24-pos dynamic key management requires the Transaction Security Services process for the SPDH Device Handler module. The SPDH Device Handler module cannot back out a failed key exchange without using the Transaction Security Services process. |
| B | Clarifies the use of the 6A and 6C Atalla premium options.

Clarifies the Atalla premium options required to support DUKPT.

Adds the Translate PIN – VISA DUKPT (31#7) command to the table of NSP online functions supported by BASE24. |
| C | Adds a discussion of the Thales double-length key encryption scheme requirements for BASE24. |
