

Name: Sagar Ganesh Sharma
Employee ID: 102033
Software Tester

BASE 24 : EMS, NCS, NEF, AUDIT (Explode / Netadrd) Assignment

Assignment:

1. Execute explode audit commands with and without parameters and write down the difference between them

AUDIT EXPLODE PARAMETERS	DESCRIPTION
● -REAL	- It shows real time audit - It will run in continuity - If not entered then audit till that time will be displayed
● -UNI	- shows repetitive messages for one time only (Uniquely)
● -TKN	- Tokens in detailed breakdown
● -DET	- Detailed Audit
● -STM COL	- STM message in proper column formatting (For ATM)
● -PSTM COL	- PSTM Message in proper column formatting (For PoS)
● -FROM -0	- 15 : Audit from last 15 minutes - 0 : Audit till the time when command has initiated - 11:00:00 : Audit from 11am will be displayed
● -NONMM	- Network Management Messages (like logon, logoff, echo) will be skipped

April 30, 2025 15:37:01

5. Prepare a document for qview, qwrite, qread

Parameters	Description
● QVIEW	- Used to view queue
● QWRITE	- Saves messages waiting in a queue (like a digital waiting line) to a file on our computer's storage for later use - Local Processes : If the messages are meant for a local program or station, QWRITE collects messages from both the main queue and the specific queue tied to that program/station. - Check Status : Uses CONTROL NODE QWRITESTATUS to see if the save operation is still running or completed.
● QREAD	- Reverses QWRITE - It takes saved messages from a file and puts them back into queues.

6. Self Study

a) All Control commands in NCS

Commands
● Start Commands
■ start line <line name>
■ start process <process name>
■ start station <station name>
■ start node <node name>
■ start link <link name>
● Stop Commands
■ stop line <line name>
■ stop process <process name>
■ stop station <station name>
■ stop node <node name>
■ stop link <link name>

● Alter Commands
■ alter <line><object name>, attribute <attribute value>
■ alter <process><object name>, attribute <attribute value>
■ alter <station><object name>, attribute <attribute value>
■ alter <node><object name>, attribute <attribute value>
■ alter <link><object name>, attribute <attribute value>
● Status Commands:
■ status line <line name>
■ status process <process name>
■ status station <station name>
■ status node <node name>
■ status link <link name>
● Info Commands:
■ info line <line name>, details
■ info process <process name>, details
■ info station <station name>, details
■ info node <node name>, details
■ info link <link name>, details

b) what is link in NCS and what is the use

- A link in NCS is the connecting path between two XPNET Nodes.
- It enables communication between nodes in logical networks
- Format: p node-id^Link^p node-id
- Example: P1A^LINK^P2B

c) study different states of station/line/process

States	Description
● ABNORMAL	The object failed after start or didn't start properly
● DISABLED	The object was disabled manually or added in disabled mode.
● STARTED	The object is running and available for normal use.
● STARTING	The object is in the process of initializing.
● STOPPED	The object is not running, either never started or shut down
● STOPPING	The object is undergoing shutdown
● SUSPENDED	The object is temporarily unavailable due to system errors.

d) What is queue and what are the possible reasons to accumulate queue on process.

- It is count of transaction request that get accumulated till the process get started.

e) Who writes audit data in audit files?

- There are two processes: External and Internal
- In **Internal**, Audit File is written by **XPNET**
- In **External**, Audit file is written by **Audit Process**
