

Future Updates

Manual: *BASE24-atm Authorization Manual*

Number: AT-AE000-08

Date: 12/2000

The following changes affect the *BASE24-atm Authorization Manual* for release 5.3. These changes will be made the next time the manual is updated.

The Authorization process now supports PIN and card verification when the BASE24-atm ISO Host Interface process sets the RQST.MULT-ACCT field in the STM to a value of 3 in host-acquired 0200 request messages. This value forces the Authorization process to prescreen the transaction even though accounts are already present in the request message. Normally, the Authorization process does not perform transaction prescreening when accounts are already present in the message. The processing steps for 0200 messages will be updated accordingly.
