Preface

This manual provides a comprehensive explanation of the BASE24 Remote Banking Customer Service Representative (CSR) screens and functions. CSR screens are accessed from the CSRC entry on the Core Product Menu. The information in this manual allows customer service representatives to use the CSR screens and functions correctly.

Audience

This manual is intended for customer service representatives who use the BASE24 CSR screens and functions regularly.

Prerequisites

Readers should be familiar with the ***BASE24 CRT Access Manual*** before reading this manual. The ***BASE24 CRT Access Manual*** provides information about logging on to BASE24, accessing screens, and using function keys. Some knowledge of BASE24 would also be beneficial, allowing readers to better understand functions of the various screen fields described in this manual.

Additional Documentation

The BASE24 documentation set is arranged so that each BASE24 manual presents a topic or group of related topics in detail. When one BASE24 manual presents a topic that has already been covered in detail in another BASE24 manual, the topic is summarized and the reader is directed to the other manual for additional information. Information has been arranged in this manner to be more efficient for readers who do not need the additional detail and, at the same time, provide the source for readers who require the additional information.

This manual contains references to the following BASE24 publications:

- The ***BASE24 Base Files Maintenance Manual*** describes the screens used to maintain all base files. Certain base files are used to control the processing of transactions initiated from CSR screens.
- The ***BASE24 Core Files and Tables Maintenance Manual*** describes the screens used to maintain all core product files and tables. Both the BASE24-telebanking and BASE24-billpay products are core products.
- The ***BASE24 CRT Access Manual*** provides information about logging on to BASE24, accessing screens, screen security, and using function keys.
- The ***BASE24 Logical Network Configuration File Manual*** contains descriptions of assigns and params that control CSR processing.
- The ***BASE24 Remote Banking End-of-Period Processing and Reporting Manual*** describes reports generated as a result of CSR processing.
- The ***BASE24 Remote Banking Transaction Processing Manual*** describes the action codes displayed on CSR response screens. This manual also describes how transactions initiated from CSR screens are processed by the system.
- The ***BASE24-billpay Billing Application Manual*** contains information for the add-on Billing Application for the BASE24-billpay product.
- The ***BASE24-billpay Tables Maintenance Manual*** describes the screens used to maintain BASE24-billpay tables.

This manual also contains references to the following American National Standards Institute (ANSI) and International Organization for Standardization (ISO) publications:

- The 1988 ANSI X3.38 standard, ***Identification of the States, the District of Columbia, and the Outlying and Associated Areas of the United States for Information Interchange***, contains the U.S. state codes used on BASE24 CSR screens.
- The 1990 ISO 4217 standard, ***Codes for the Representation of Currencies and Funds***, contains the currency codes used on BASE24 CSR screens.
- The 1993 ISO 3166 standard, ***Codes for the Representation of Names of Countries***, contains the country codes used on BASE24 CSR screens.

Software

This manual documents standard processing for the following BASE24 products:

- BASE24-billpay release 1.3
- BASE24-telebanking release 1.3

BASE24-telebanking release 1.3 is required when BASE24-billpay release 1.3 is installed. Refer to the ***BASE24 Remote Banking Transaction Processing Manual*** for an explanation of how the BASE24-telebanking and BASE24-billpay products work together.

Customer-specific code modifications (that is, CSMs) may result in processing that differs from the material presented in this manual. The customer is responsible for identifying and noting these changes.

Manual Summary

The following is a summary of the contents of this manual.

“Conventions Used in this Manual” follows this preface and describes notation and documentation conventions necessary to understand the information in the manual.

Section 1, “Introduction,” provides an introduction to the CSR screens and functions. It introduces CSR screens and functions, defines the relationships that exist among CSR screens, defines the standard function keys used on CSR screens, describes the help screens available from CSR screens, and discusses CSR processing controls.

Section 2, “Customer Service Terminology,” defines terms that are basic to understanding the BASE24-telebanking and BASE24-billpay CSR screens.

Section 3, “CSR Procedures,” describes step-by-step procedures to aid you in the daily handling of customer requests. Procedures are provided for all the transactions that can be executed from a CSR terminal.

Section 4, “Account List Inquiry Response,” describes the BASE24-telebanking screen used to list all the application accounts currently configured to the system for a customer. Up to five accounts can be listed on this screen at one time.

Section 5, “Multiple Account Balance Inquiry Response,” describes the BASE24-telebanking screen used to display the available balance or credit for all application accounts currently configured to the system for a customer. Up to three account balances can be listed on this screen at one time.

Section 6, “Account Selection,” describes the BASE24-telebanking screen used to select individual application accounts on which a transaction is to be performed when two or more customer accounts exist with the same account number or account type specified.

Section 7, “Authorization Request,” describes the screen used to enter BASE24-telebanking transactions. The format of the screen varies according to the specific transaction selected.

Section 8, “Authorization Response,” describes the screen used to display the response for approved balance inquiry, PIN change, PIN verify, transfer, and user-defined transactions, as well as for any BASE24-telebanking transaction that was denied. For approved balance inquiry transactions and, optionally, for approved PIN verify transactions, this screen also displays balance information for specified accounts. For denied transactions, this screen indicates the reason for the denial.

Section 9, “Bank List,” describes the BASE24-billpay screen used to select a financial institution when signing up new BASE24-billpay customers.

Section 10, “Branch List,” describes the BASE24-billpay screen used to select a financial institution branch for a BASE24-billpay customer and return it to either the Customer Information or Customer Signup screens.

Section 11, “Check Stop Payment Add Response,” describes the BASE24-telebanking screen used to view the result of a check stop payment add transaction on behalf on a customer.

Section 12, “Customer Account List,” describes the BASE24-billpay screen used to view all the application accounts available to a customer and to select individual accounts on which transactions are to be performed.

Section 13, “Customer Information,” describes the BASE24-billpay screen used to view and update customer information for activated BASE24-billpay customer IDs. You can also deactivate customer IDs from this screen.

Section 14, “Customer Personal Detail,” describes the BASE24-telebanking screen used to view detailed personal customer information when verifying the identity of a customer.

Section 15, “Customer Signup,” describes the BASE24-billpay screen used to sign up new customers for BASE24-billpay service. You can add and update customer information as well as activate customer IDs from this screen.

Section 16, “Customer Vendor Detail,” describes the BASE24-billpay screen used to view and update detailed customer vendor information as well as add new customer vendors, if allowed. From this screen you can also remove customer vendors that are no longer needed from service and print a list of all the customer’s vendors.

Section 17, “Customer Vendor List,” describes the BASE24-billpay screen used to list up to five customer vendors at a time. From this screen you can select an individual customer vendor for which a payment is to be made or for which detailed information is to be displayed, and print a list of all the customer’s vendors.

Section 18, “Customer Vendor Mask Verify,” describes the BASE24-billpay screen that is used to review all account masks that are available for a vendor and vendor branch combination.

Section 19, “Customer Vendor Mask Verify Detail,” describes the BASE24-billpay screen that is used to review information associated with a single account mask and the checks performed for an account with a vendor.

Section 20, “Customer Verify Request,” describes the BASE24-telebanking screen used to begin verification of a customer. This screen is the first screen accessed for each customer call.

Section 21, “Customer Verify Response,” describes the BASE24-telebanking screen used to verify the identity of the customer. From this screen you can verify the customer’s PIN, change the customer’s PIN, display detailed personal customer information, and access the Transaction Menu.

Section 22, “Last Transaction Response,” describes the BASE24-telebanking screen used to list up to five previous transactions that match the criteria specified in an inquiry.

Section 23, “Loan Application,” describes the BASE24-billpay screen that allows you to enter a loan application on behalf of a customer.

Section 24, “Miscellaneous Request,” describes the BASE24-billpay screen that allows you to enter customer questions, complaints, or account maintenance requests that fall outside the scope of BASE24-billpay customer service.

Section 25, “Multiple Customer Selection,” describes the BASE24-telebanking screen that allows you to select an individual customer when multiple customer/customer ID combinations are found when verifying a customer.

Section 26, “New Payment,” describes the BASE24-billpay screen that allows you to schedule an immediate, future, or recurring payment on behalf of a customer.

Section 27, “New Transfer,” describes the BASE24-billpay screen that allows you to schedule a future or recurring transfer on behalf of a customer.

Section 28, “Scheduled Payment Detail,” describes the BASE24-billpay screen that allows you to view detailed information for a scheduled payment. From this screen you can also update or delete a scheduled payment as well as skip the next payment period for a recurring scheduled payment.

Section 29, “Scheduled Transactions,” describes the BASE24-billpay screen used to list all of the currently scheduled transactions for a customer. From this list you can select to view detailed information for an individual transaction, delete a scheduled transaction, or skip the next transfer or payment period for a recurring scheduled transaction.

Section 30, “Scheduled Transfer Detail,” describes the BASE24-billpay screen that allows you to view detailed information for a scheduled transfer. From this screen you can also update or delete a scheduled transfer as well as skip the next transfer period for a recurring scheduled transfer.

Section 31, “Statement Closing Download Response,” describes the BASE24-telebanking screen that enables you to view closing statement information on behalf of a customer.

Section 32, “Statement Download Response,” describes the BASE-telebanking screen that enables you to view statement information on behalf of a customer.

Section 33, “Transaction History,” describes the BASE24-billpay screen that allows you to peruse BASE24-billpay transaction activity for a customer. On this screen you can view all financial and nonfinancial transactions processed for the customer or only those payment transactions that are considered to have been paid. You can also select individual transactions for which detailed information is displayed. Up to three transactions can be viewed on this screen at one time.

Section 34, “Transaction History Detail,” describes the BASE24-billpay screen that allows you to view detailed information for a BASE24-billpay transaction selected from the Transaction History screen.

Section 35, “Transaction Menu,” describes the BASE24-telebanking menu that allows you to select individual BASE24-telebanking and BASE24-billpay transactions to be performed. When you select a transaction on this menu, the first screen required to perform the transaction is displayed.

Section 36, “Transaction Selection,” describes the BASE24-telebanking screen that allows you select the account types on which a BASE24-telebanking transaction is to be performed.

Section 37, “Vendor Detail,” describes the BASE24-billpay screen that is used to display the vendor and vendor branch information.

Section 38, “Vendor Registry,” lists all the vendors currently registered to the system. Up to three registered vendors are displayed on this screen at one time. You can select an individual vendor and return the vendor information to the Customer Vendor Detail screen when adding a customer vendor for a customer.

A glossary that contains definitions for various terms related to CSR screens and processing follows the last section.

Readers can use the index by field name to locate information about a particular screen field and the index by data and column name to locate information about a particular field from a file, column from a table, or record structure.

Publication Identification

Two entries appearing at the bottom of each page uniquely identify this BASE24 publication. The publication number (for example, TB-DT010-01 for the ***BASE24 Remote Banking Customer Service Support Manual***) appears on every page to assist readers in applying updates to the appropriate manual. The publication date (for example, 09/2000 for September, 2000) identifies the last time material on a particular page has been revised. This date can be used to verify that the reader has the most current information and is particularly helpful when dealing with HELP24 to answer operating questions.

The print record, located on the page immediately following the title page, is also helpful when verifying that a manual contains the most current information. An entry is added to the print record each time a BASE24 publication is modified in any way. Each print record entry includes the date of the change, a unique version number, and the type of change (new, update, or reissue). Version 1 is assigned to a *new* manual. Later versions can be updates or reissues, depending on the

changes being made. An *update* typically involves changes on a small number of pages throughout the manual. A *reissue* occurs when all pages of the manual are replaced because changes affect a large number of pages.

Conventions Used in this Manual

This section explains the different terminology used to describe the CSR screens used to maintain data in Enscribe files and Structured Query Language (SQL) tables, and how field descriptions, required blank characters, and unlabeled fields are documented in this manual.

Enscribe Files and SQL Tables

Throughout this manual, specific terminology is used when discussing screens that access Enscribe files or SQL tables. For Enscribe files, the terms field, record, and file are used. For SQL tables, the analogous terms of column, row, and table are used, respectively.

Field Descriptions

Each field appearing on a CSR screen is listed by name and then described. Field descriptions in this manual briefly summarize the contents, purpose, and permissible values, as shown in the following examples taken from the Customer Verify Request screen and the Last Transaction Response screen. The Customer Verify Request screen allows you to enter information stored in an SQL table, while the Last Transaction Response screen allows you to retrieve information stored in an Enscribe file.

SQL Table Example

CUSTOMER ID — The unique identification number assigned to this customer. An unlimited number of individual application accounts and persons can be associated with one customer ID, and one customer can be associated with several customer IDs. The customer ID entered in this field must match a customer ID defined to the system.

If more than one customer has access to the specified customer ID, the Multiple Customer Selection screen will be displayed after pressing the **F2** key. You must then select an individual customer on this screen and press the **F1** key to continue customer verification processing.

Field Length: 1–19 alphabetic or numeric characters
Required Field: Yes, if no entries are made in either the ACCT NUMBER or NAME fields.
Default Value: No default value
Column Name: CSTT.PAN

Enscribe File Example

TYPE — A code indicating whether this transaction debited or credited the customer account. A transfer is either a debit or credit, depending on whether this transaction was performed on a *from* account or *to* account, respectively. Valid values are as follows:

CR = This transaction credited the customer account. This includes all transfers and deposits to this account.
DB = This transaction debited the customer account. This includes all checks, payments, withdrawals, and transfers from this account.

Field Length: 5 fields, system-protected
Data Name: THF.ALT-KEY4.DB-CR-IND

Explanation

Each field description is completed by one or more of the following items of information:

Item	Description
Example	Illustrates a possible entry for the field to further clarify the value or values that can be entered.

Item	Description
Field Length	Specifies the size of the field and the type of characters that can be entered. This length refers to the field and valid values for the file maintenance screen, not the field in the DDLs. Possible values are alphabetic, alphanumeric, hexadecimal, and numeric. The term <i>alphanumeric</i> includes all alphabetic, numeric, and special characters that can be entered from a keyboard without using a control sequence. The term <i>hexadecimal</i> includes all numbers and the letters A through F. When a field value cannot be modified by the operator, the field length is System-protected.
Occurs	Indicates the number of times the field can be displayed on the screen. This information is provided only when the field can be displayed multiple times.
Required Field	Specifies whether a value has to be entered in the field. Possible values are Yes and No. Some fields are required only under certain conditions. In this case, the entry is Yes, followed by the conditions that determine when the field is required.
Default Value	Specifies the value that is automatically placed in the field when the screen is first displayed or when the F8 key is pressed to clear the screen.
Data Name	Provides the DDL name associated with the field appearing on the screen. Data names are included in the documentation to assist in communicating screen and field issues to your technical staff. Note that screen data is not always stored in the BASE24 database as it appears on the screen or as it is described in the field description. If you need information on how screen data is actually stored, consult the DDLs.

Item	Description
Column Name	Provides the SQL column name associated with the field appearing on the screen. Column names are included in the documentation to assist in communicating screen and field issues to your technical staff. Note that screen data is not always stored in the BASE24 database as it appears on the screen or as it is described in the field description. If you need information on how screen data is actually stored, consult the DDLs or SQL table creation source file.

Required Blank Spaces

Throughout this manual when discussing the impact of required blanks or spaces in entered field data, the $\emptyset$ symbol is used to denote a required blank character or space.

Unlabeled Fields on Screens

Angle brackets (< >) indicate an unlabeled field on a screen. An unlabeled field is a field that is present on a screen but is not preceded by an identifying literal label. For the purposes of documenting the field, a label has been assigned and appears inside the angle brackets. A multiple line unlabeled field is displayed as a shaded area and also has a label in angle brackets.

In the field descriptions for the screen, the unlabeled field appears according to its place on the screen and is identified by the same label.

Unlabeled fields are not included in the index by field name; they appear by subject in the main index.

Section 1

Introduction

This section introduces the customer service representative (CSR) functions specific to BASE24 Remote Banking products and the screens and function keys used to access them. Currently, BASE24-telebanking and BASE24-billpay are the only remote banking products.

This section includes a discussion of the following topics:

- Introduction to remote banking products
- CSR screen characteristics
- CSR screen access
- CSR screen descriptions
- CSR screen functions and relationships
- Standard CSR screen function keys
- CSR help screens
- CSR processing controls and reporting
- CSR table and file usage
- Enscribe file record access
- SQL table row access

Remote Banking Products

The BASE24 Remote Banking product family currently includes two products—BASE24-telebanking and BASE24-billpay.

The BASE24-telebanking product provides online banking services (e.g., balance inquiries, check clearance inquiries, immediate transfers between two accounts, and stopping payment on a check) to customers using remote banking devices (e.g., a touch-tone telephone or personal computer) or calling a customer service representative or branch employee.

The BASE24-billpay product provides automated payment and scheduled transfer services (e.g., immediate, future, and recurring payments, future and recurring transfers, and associated inquiries) to customers using remote devices or calling a customer service representative or branch employee. The BASE24-billpay product provides files that can be used as input to programs that generate checks and automated clearing house (ACH) output for payments; however, the BASE24-billpay product does not currently include these programs. The BASE24-billpay product also provides facilities for signing up new customers and accounts, accessing customer information, listing financial institutions and branches, and entering or inquiring on loan applications and miscellaneous requests.

Optional Enhanced Telebanking product modules provide financial institutions and service providers the ability to support all BASE24-telebanking transactions as well as the subset of banking transactions that are provided with the BASE24-billpay product. These product modules consist of a subset of the BASE24-billpay software.

Enhanced Telebanking provides for the scheduling of one-time future transfers and recurring transfers. The product modules monitor future and recurring transfers, and on the scheduled transaction date, automatically initiate the transfer transaction. When Enhanced Telebanking initiates a transfer, BASE24 routes the transaction to the appropriate authorizing entity for authorization. Various reports are available directly related to these transfer transactions.

Enhanced Telebanking also supports customer and account maintenance transactions, financial institution and financial institution branch list inquiry transactions, loan application transactions, and miscellaneous request transactions.

The BASE24-telebanking software provides customer verification and funds authorization functions used to support the services provided by the BASE24-telebanking, Enhanced Telebanking, and BASE24-billpay products.

Customer verification involves identifying the customer and verifying his or her authenticity. Funds authorization involves checking the customer's account to ensure that sufficient funds are available to perform a transfer or payment.

Because the BASE24-billpay and Enhanced Telebanking products rely on the BASE24-telebanking software to support its services, BASE24-billpay and Enhanced Telebanking cannot be installed without BASE24-telebanking. The BASE24-telebanking product can be installed without the BASE24-billpay or Enhanced Telebanking product; however, scheduled transfer capabilities and customer signup functions are available only if both the BASE24-telebanking product and either the Enhanced Telebanking or BASE24-billpay products are installed.

This manual documents both BASE24-telebanking and BASE24-billpay CSR screens. If the BASE24-billpay product is installed, you can access both BASE24-telebanking and BASE24-billpay CSR screens. If the BASE24-billpay product is not installed, you can access only BASE24-telebanking CSR screens. In this manual, the introduction to each screen indicates whether it is a BASE24-telebanking or BASE24-billpay CSR screen.

Note: If the Enhanced Telebanking product modules are installed instead of the BASE24-billpay product, some BASE24-billpay screens (e.g., New Payment screen, Scheduled Payment Detail screen, Customer Vendor List screen, Vendor Registry screen, etc.) may not be functional.

Customer Service Terminology

BASE24-telebanking and BASE24-billpay CSR screens use a number of terms specific to remote banking processing from a CSR terminal. Refer to section 2 for definitions of terms related to the following topics:

- Customers
- Vendors
- Accounts
- Transactions
- Billing

CSR Screen Characteristics

This subsection describes the general characteristics of CSR screens.

Screen Header

Each CSR screen contains a standard screen header that is displayed on the first line of all BASE24 screens. This line displays the screen name or requester that supports the screen, the current logical network, the current system date and time, and the current screen number. For more information on this header, refer to the *BASE24 CRT Access Manual*.

Customer Header

Each CSR screen contains a header containing relevant customer context information (i.e., the name of the customer's financial institution, the customer's ID, and optionally, the customer's name and a customer account number) obtained during customer verification. This information is displayed on lines 3 and 4 of CSR screens and is retained for your entire session with the customer. As you move from one screen to the next, this information is carried between the screens in the header at the top of each screen. This saves you from having to reenter the same information on multiple screens.

The current customer account number and account type are also retained from one screen to the next until you select a different account or account type for the customer.

Additional customer context information is retained by the system for each session with a customer, but this information is not displayed on CSR screens. This information includes the multiple account selection display option and route profile for the customer's financial institution, the customer's personal ID, and the date display format option for the system.

The current customer context information is retained until you verify a different customer.

Screen Body

The body of CSR screens is displayed on lines 5 through 20. The body contains fields in which you can enter and display data relevant to the transaction selected. On certain BASE24-telebanking transaction response screens, line 20 may display informational screen messages.

Screen Footer

Every CSR screen contains a screen footer that displays the important function keys for the screen as well as informational or error screen messages. The screen footer is displayed on lines 21 through 24. BASE24-telebanking CSR screens and associated help screens also contain a FILE DESTINATION field that can be used to directly access other BASE24 screens (if you have security access to the destination screen).

Date and Time Display

Date fields on CSR screens can occur in two places. The current system date and time are always displayed, in YY/MM/DD format, on the first line of every CSR screen. On some BASE24-billpay CSR screens, date and time fields are also displayed in the body of the screen. The format in which these date fields are displayed on BASE24-billpay CSR screens is controlled by the BP-DATE-FORMAT param in the Logical Network Configuration File (LCONF). The value of this param specifies the format in which dates must be entered and how they are displayed. Whenever a date field appears on a screen, the value of this param is also displayed somewhere on the screen to aid you in entering and viewing dates in the proper format. The possible values for this param are as follows:

- YYYYMMDD
- YYMMDD
- MMDDYY
- MMDDYYYY
- YYYYDDMM
- YYDDMM
- DDMMYY
- DDMMYYYY

In these values, YYYY or YY represents the year, MM represents the month of the year, and DD represents the day of the month. This param defaults to a value of YYYYMMDD.

Dates are always entered according to the displayed format without the use of separators (e.g., / characters).

Time is always expressed using 24-hour time. For display-only fields, such as in the first line of each screen, the time is in the form hh:mm; however, for data entry the form is hhmm. If seconds are also displayed, the form is hh:mm:ss.

Screen Fields

Fields appearing on CSR screens enable you to either enter data or display data. Fields that enable you to enter values are referred to as data-entry fields while fields that only display data are referred to as system-protected fields. You can use the **Tab** key or the cursor arrow keys to move among data-entry fields, while you cannot position the cursor in system-protected fields. Certain field attributes (e.g., highlighting or underlining) are used to differentiate data-entry fields from display-only fields on the screen. The attributes used depend on whether the screen is a BASE24-telebanking screen or a BASE24-billpay screen. On BASE24-telebanking screens, data-entry fields are always highlighted on the screen, while system-protected fields are not highlighted. On BASE24-billpay screens, data-entry fields are always underlined while system-protected fields are not underlined.

Amount Fields

Amounts can be entered in whole and fractional currency units. Fractional currency units are digits entered to the right of a decimal point.

On BASE24-telebanking CSR screens, the currency designated in the COBNAMES table for your system is used whenever an amount is entered if you do not enter a currency code on the screen. On BASE24-billpay CSR screens, the LGNT-COUNTRY-ABBR param in the Logical Network Configuration File (LCONF) indicates the country in which transactions are acquired, and, therefore, the type of currency in which amounts are entered. In both cases, the type of currency dictates the number of decimal points allowed for amount fields. For more information on the LGNT-COUNTRY-ABBR param, refer to the ***BASE24 Logical Network Configuration File Manual***.

If the currency does not allow fractional currency units, a decimal point cannot be entered in amount fields.

If a currency allows fractional currency units and you do not account for all the fractional currency units when you enter an amount, the system automatically pads the amount with zeros to the right and assumes the correct number of fractional currency digits. For example, if a currency allows for two fractional currency units, amounts are padded and a decimal point is inserted as follows:

Amount You Enter:	Amount After Padding:
1000	10.00
10	.10
10.0	10.00
10.1	10.10
.1	.10
10.	10.00

In another example, if a currency allows for three fractional currency units, amounts are padded and a decimal point is inserted as follows:

Amount You Enter:	Amount After Padding:
10000	10.000
10	.100
10.0	10.000
10.1	10.100
.1	.100
10.	10.000
10.12	10.120

If you attempt to enter more fractional currency units in an amount field than are allowed by the currency, an error message is displayed indicating that the amount you entered is invalid.

Balance Displays

All balances displayed on the BASE24-telebanking Authorization Response screen are displayed in whole and fractional currency units for the currency designated in the COBNAMES table for your system. If a currency code is not defined in this file, no decimal points are displayed for the balance amounts. In addition, if an account has a negative balance, the balance amount can include a minus sign.

Confirmation of Deletion, Expiration, or Cancellation

On most CSR screens, the system automatically prompts you to confirm that the deletion, expiration, or cancellation of an item being requested is valid. This prevents you from inadvertently removing data from the system. On BASE24-telebanking CSR screens, the system does not prompt you for confirmation when canceling a transaction.

Standard Information Messages

Most informational and error messages to you are displayed on the last line of CSR screens, immediately beneath the displayed function key usage. On certain BASE24-telebanking response screens, informational messages can also be displayed on the last line of the screen body. Messages can indicate whether a requested operation is valid, whether the operation has completed or failed, or can indicate that invalid data has been entered in one or more screen fields.

Screen Timeout

Most CSR screens have a built-in timeout for security reasons so when you leave a terminal unattended for too long, the current screen times out and the previously accessed screen is displayed. If the terminal remains unattended for a long enough duration, eventually the screen time outs will take you back to the BASE24 Logon screen.

CSR Screen Access

CSR screens are accessed by selecting the CSRC entry on the Core Product Menu, which can be accessed from the BASE24 Virtual Menu. If you have security access to only the CSR screens, you will not have access to the BASE24 Virtual Menu or Core Product Menu. Instead, the Customer Verify Request screen will be displayed immediately after you log on.

On the Core Product Menu, you will see only the screens available to you based your security access configured in the Security File (SEC). A sample Core Product Menu listing all possible file, table, and function screens is shown below. The order that the screens are displayed is dependent on the order that you received security access to the screens in the SEC.

You can access an item listed on this menu by placing the cursor beside an individual item and pressing the **F1** key or by entering the screen acronym in the FILE DESTINATION field and pressing the **F1** key. For a more detailed explanation for accessing screens, refer to the *BASE24 CRT Access Manual*.

CSR Screen Introductions

This subsection provides a brief introduction to each of the CSR screens. Each description indicates the section of the manual in which the screen is described. The screens are categorized according to which of the following functions they support:

- Verifying customers
- Selecting transactions
- Performing BASE24-telebanking transactions
- Performing BASE24-billpay transactions

Each of these functions is described in detail later in this section.

Customer Verification Screens

The following paragraphs describe each of the CSR screens accessed to support the customer verification function. These screens are used to verify both BASE24-telebanking and BASE24-billpay customers.

Customer Verify Request screen — Enables you to enter a customer ID, customer account number, or customer name to begin verification processing. This is required when verifying an existing customer and optional when signing up a new customer or entering a loan application on behalf of the customer. This screen is the initial screen displayed when you select the CSRC entry on the Core Product Menu. All sessions with a customer must begin with this screen. You can display the Customer Verify Request screen at any time by pressing a function key on any CSR screen. The Customer Verify Request screen is described in section 20.

Customer Verify Response screen — Indicates whether the customer's PIN needs to be verified or changed, the type of customer (that is business or individual), the status of the customer's ID, and customer verification information configured to the system. This screen is displayed when you press a function key on the Customer Verify Request screen to verify the customer. From this screen you can verify the customer's PIN, change the customer's PIN, access detailed personal information for the customer, access the Customer Signup screen to activate a new customer, access the Transaction Menu to select a transaction, or redisplay the Customer Verify Request screen to change customers. The Customer Verify Response screen is described in section 21.

Customer Personal Detail screen — Displays detailed personal information configured to the system for the customer. This screen enables you to verify additional personal information that is not provided in the CUSTOMER VERIFICATION INFORMATION fields on the Customer Verify Response screen. This screen is displayed when you press the appropriate function key on the Customer Verify Response screen and personal information is configured for the customer. The Customer Personal Detail screen is described in section 14.

Multiple Customer Selection screen — Enables you to select a specific customer ID and customer relationship to be verified. This screen displays multiple customer ID and customer selections for the following situations when you attempt to verify a customer on the Customer Verify Request screen:

- The entered customer ID can be accessed by more than one customer
- A full or partial customer name is entered.

If the entered customer name does not exactly match the name of a customer configured to the system, the system might return several customer entries with names similar in spelling to the name you entered. This only applies if your system uses a name algorithm (e.g., Soundex). For more information on name algorithms, refer to the PIT-NAM-ALGO param description in the *BASE24 Logical Network Configuration File Manual* and to section 3 of this manual.

The Multiple Customer Selection screen is described in section 25.

Authorization Request screen — Enables you to authorize a PIN change or PIN verify transaction on behalf of the customer. The fields displayed on this screen vary according to the transaction requested. The Authorization Request screen is described in section 7.

Authorization Response screen — Indicates the processing outcome of a PIN change or PIN verify transaction authorization request. The action code, action code description, and approval code indicate whether the PIN was successfully changed or verified. An approval code is provided only if the transaction was approved and if the authorizer generated one. For approved PIN verify transactions, balance information may also be displayed for the customer's designated default account. The Authorization Response screen is described in section 8.

Transaction Selection Screens

The following paragraphs describe each of the CSR screens accessed to support transaction selection. Customer verification must be completed before you can access these screens.

Transaction Menu — Enables you to select a BASE24-telebanking or BASE24-billpay transaction to be performed. This screen is displayed when you press the **F4** key on any CSR screen. Only the transactions configured in the Transaction Type by Source Code Table (TTSC) are displayed on this menu. The Transaction Selection screen or the Authorization Request screen is displayed when you select a BASE24-telebanking transaction. The initial screen required to perform the selected transaction is displayed when you select a BASE24-billpay transaction. The Transaction Menu is described in section 35.

Transaction Selection screen — Enables you to select the specific account types on which a BASE24-telebanking transaction is to be performed. This enables the system to determine the actual accounts on which the transaction is performed without you having to enter an account number or account qualifier to identify the accounts. Only the transactions and account types configured in the Processing Code Definition File (PCDF) are displayed on this screen. After you select a transaction and account types on the screen, the Authorization Request screen is displayed. The Transaction Selection screen is described in section 36.

BASE24-telebanking Transaction Screens

The following paragraphs describe each of the CSR screens accessed to support BASE24-telebanking transactions. Customer verification must be completed and a BASE24-telebanking transaction must be selected before you can access these screens.

Account List Inquiry Response screen — Displays all the customer accounts configured for a customer ID. This screen overlays the bottom half of the Authorization Request screen from which a customer account list inquiry transaction was originated and approved.

This screen always displays an action code and description indicating that the inquiry transaction was approved, an approval code (if one was generated by the authorizer), and the date the inquiry transaction was posted. If the customer account list inquiry transaction is denied, the Authorization Response screen is displayed instead.

For each account configured to the system, this screen displays the account number, the account type description (e.g., SAV for a savings account), the account qualifier (e.g., SAV1), the identifier of the financial institution that owns the account (FIID), the current status of the account, an account description, and flags indicating whether the account allows debit, credit, or inquiry transactions. The Account List Inquiry Response screen is described in section 4.

Account List Inquiry with Balances Response screen — Displays the available balance or credit for all the customer accounts configured for a customer ID. This screen overlays the bottom half of the Authorization Request screen from which an account list inquiry with balances transaction was originated and approved.

This screen always displays an action code and description indicating that the inquiry transaction was approved and an approval code (if one was generated by the authorizer). If the account list inquiry with balances transaction is denied, the Authorization Response screen is displayed instead.

For each account configured to the system, this screen displays the account number, the account type description (e.g., SAV for a savings account), the available balance or credit, the date the balance was determined, the identifier of the financial institution that owns the account (FIID), an action code, an account description, the account qualifier (e.g., SAV1), the ledger balance or credit limit for the account, and the current status of the account. The Account List Inquiry with Balances Response screen is described in section 5.

Account Selection screen — Enables you to select individual accounts for which a transaction is to be performed. This screen is used when multiple account selection is enabled and two or more accounts exist for the requested account number or account type when you attempt to authorize a BASE24-telebanking transaction. When this screen is displayed, you must select the particular account on which the transaction is to be performed. The Account Selection screen is described in section 6.

Authorization Request screen — Enables you to enter information required to authorize BASE24-telebanking transactions. The fields displayed on this screen vary according to the transaction selected. After entering the required and optional data for the selected transaction, you press a function key to authorize the transaction. This screen is displayed when you select the ACCOUNT LIST or ACCOUNT LIST WITH BALANCES transaction from the Transaction Menu or any other BASE24-telebanking transaction type/account type combination from the Transaction Selection screen. All fields are displayed on the top half of the

screen so that this information is retained when the appropriate response information is overlaid on the bottom half of the screen. The Authorization Request screen is described in section 7.

Authorization Response screen — Indicates the processing outcome of a BASE24-telebanking transaction request. The Authorization Response screen overlays the bottom half of the Authorization Request screen from which the transaction originated. This screen displays the action code and action code description indicating whether the transaction was approved or denied, an approval code if the transaction was approved, the date the transaction was posted, and the current amount available for withdrawal for the *from* account. For approved available funds inquiry transactions, this screen also displays the balances of the accounts requested. The Authorization Response screen is described in section 8.

Check Stop Payment Add Response screen — Indicates the processing outcome of a check stop payment add transaction request. The Check Stop Payment Add Response screen overlays the bottom half of the Authorization Request screen in the check stop payment add transaction format from which the check stop payment add request originated. This screen displays the action code and action code description indicating whether the transaction was approved or denied, an approval code if the transaction was approved, the date the transaction was posted, and the stop date and time of the check stop payment add order. The Check Stop Payment Add Response screen is described in section 11.

Last Transaction Response screen — Displays transactions from the Transaction History File (THF) that match the parameters you requested. This screen overlays the bottom half of the Authorization Request screen from which the transaction originated when any of the following reserved BASE24-telebanking inquiry transactions are approved:

- Last count of debit/credit transactions inquiry
- Last count of account by source transactions inquiry
- Last count of check transactions inquiry
- Last count of debit transactions inquiry
- Last count of credit transactions inquiry
- Last count of account transfer transactions inquiry

This screen always displays an action code indicating that the inquiry transaction was approved, an approval code (if one was generated by the authorizer), and the date the inquiry transaction was posted. If the inquiry transaction is denied, the Authorization Response screen is displayed instead.

For each transaction returned in the response, this screen displays the date of the transaction, the transaction amount, type of transaction (credit or debit), a code indicating the transaction source (e.g., a remote banking device), a flag indicating whether account funds were sufficient for the transaction, a flag indicating whether the transaction is a reversal, and a host code if the transaction was authorized on a host. The host code can contain any data the authorizer places in this field. The Last Transaction Response screen is described in section 22.

Statement Closing Download Response screen — Displays closing statement information that typically appears as part of a paper statement. This information includes the action code and description, approval code, transaction ID, statement closing date, closing balance, and beginning and ending post dates. This screen overlays the bottom half of Authorization Request screen 1, one-sided set 3 format. This screen is described in section 31.

Statement Download Response screen — Displays transactions and balances that are typically part of a regular paper statement. This screen displays the action code and description, approval code, posting date, transaction type and code information, and payee information (for payment transactions only). The screen has two formats: one for payments and one for other transactions. This screen is described in section 32.

BASE24-billpay Transaction Screens

The following paragraphs describe each of the CSR screens accessed to support BASE24-billpay transactions. These screens are provided only if the BASE24-billpay product is installed on your system. Customer verification must be completed and a BASE24-billpay transaction must be selected before you can access most of these screens. The Customer Signup and Loan Application screens can be accessed without performing customer verification.

Bank List screen — Displays all the financial institutions configured to the system. The Bank List screen enables you to select previously defined financial institutions when signing up new customers for BASE24-billpay service. The Bank List screen is described in section 9.

Branch List screen — Displays all the financial institution branches configured for a specified financial institution and city. This screen enables you to select a specific financial institution branch to be the main branch for servicing the BASE24-billpay customer's account when signing up new customers or obtaining customer information. The Branch List screen is described in section 10.

Customer Account List screen — Displays all the accounts configured to the system for the BASE24-billpay customer's ID. On this screen, you can add new accounts when signing up new customers, modify account information, or select individual accounts on which payment and transfer transactions are to be performed. The Customer Account List screen is described in section 12.

Customer Information screen — Displays customer information for update and review. This screen enables you to review and update customer information as well as to deactivate customer IDs. The Customer Information screen is described in section 13.

Customer Signup screen — Displays fields used to sign up new customers for BASE24-billpay service. Depending on the way the customer's financial institution handles new customers, customer information may be preloaded, or you might need to enter it on this screen. If customer information is preloaded, the Customer Signup screen enables you to review and update customer information and activate the customer's ID. If customer information is not preloaded, you are also allowed to add the initial customer information on this screen. The Customer Signup screen is described in section 15.

Customer Vendor Detail screen — Enables you to add or update customer vendors for a customer ID. Customer vendors can be added in two ways. If the vendor is already registered to the system, you can select the existing vendor from the Vendor Registry screen and add the customer vendor for the customer. If the vendor is not already registered to the system, you must obtain the relevant vendor information from the customer and add the vendor to the database. Adding a vendor using this method registers the vendor to the system and adds the customer vendor for the customer. You can add unregistered vendors only if your system uses an open vendor database. If the customer has more than one account with the same vendor, a separate customer vendor must exist for each account relationship with the vendor. The system automatically assigns a customer vendor number for each customer vendor you add. You also can use this screen to remove customer vendors from service. The Customer Vendor Detail screen is described in section 16.

Customer Vendor List screen — Displays up to six customer vendors at a time for a customer ID. This screen enables you to select and return customer vendor information to either the Customer Vendor Detail screen or to the New Payment screen. Customer vendors can be read by customer vendor number or by vendor name. From this screen, you can also request that a current list of all the customer's vendors (Customer Vendor List) be printed and sent to the customer. The Customer Vendor List screen is described in section 17.

Customer Vendor Mask Verify screen — Displays up to 12 account masks associated with a particular vendor and vendor branch. This screen enables you to review all relevant account masks for a vendor and vendor branch, verify a customer account with vendor before adding a new customer vendor, and view detailed information for a particular account mask. This screen is accessed from the Customer Vendor Detail screen. The Customer Vendor Mask Verify screen is described in section 18.

Customer Vendor Mask Verify Detail screen — Displays detailed information for a particular account mask selected on the Customer Vendor Mask Verify screen. The Customer Vendor Mask Verify Detail screen is described in section 19.

Loan Application screen — Enables you to enter a loan application on behalf of a customer. You can access this screen from the Transaction Menu or directly from the Customer Verify Request screen for customers who are not defined to the system. The Loan Application screen is described in section 23.

Miscellaneous Request screen — Enables you to enter miscellaneous customer requests (e.g., complaints, inquiries, or account maintenance requests) that fall outside the scope of BASE24-billpay service. These requests are stored in a table and are printed on a report for later perusal and execution by the appropriate financial institution or service provider personnel. This screen can be accessed from the Transaction Menu and the Customer Information screen. The Miscellaneous Request screen is described in section 24.

New Payment screen — Enables you to execute an immediate payment and schedule future and recurring payments. The screen has two display formats—one for the entry of a new payment and a second to display response information for approved or denied immediate payments, denied future payments, and denied recurring payments. For approved scheduled payments, the Scheduled Payment Detail screen is displayed. The New Payment screen can be accessed from the Transaction Menu, Customer Information, Customer Vendor Detail, and Scheduled Transactions screens. The New Payment screen is described in section 26.

New Transfer screen — Enables you to schedule future and recurring transfers. The screen has two display formats—one for the entry of a new transfer and a second to display response information for denied future or recurring scheduled transfers. For approved scheduled transfers, the Scheduled Transfer Detail screen is displayed. The New Transfer screen can be accessed from the Transaction Menu, Customer Information, and Scheduled Transactions screens. The New Transfer screen is described in section 27.

Scheduled Payment Detail screen — Displays the details of a selected future or recurring scheduled payment. Using this screen, you can update a future or recurring scheduled payment, delete a future or recurring scheduled payment, or skip the next payment period for a recurring scheduled payment. This screen is displayed when a new future or recurring scheduled payment is entered and approved. You can also access this screen from the Scheduled Transactions screen to obtain detailed information on a specified scheduled payment. The Scheduled Payment Detail screen is described in section 28.

Scheduled Transactions screen — Displays all currently scheduled transfers and payments for a particular customer ID. From this screen, you can delete a particular future or recurring scheduled transfer or payment, skip the next payment period for a recurring scheduled payment, skip the next transfer period for a recurring scheduled transfer, and view transaction detail for a particular scheduled transaction. You can also peruse scheduled transactions in reference number or next action date order. This screen is accessed by pressing a function key on the Customer Information screen or by selecting any of the following default transactions from the Transaction Menu:

- SCHEDULED PAYMENT UPDATE
- SCHEDULED TRANSFER UPDATE
- SCHEDULED PAYMENT DELETE
- SCHEDULED TRANSFER DELETE
- SCHEDULED PAYMENTS INQUIRY
- SCHEDULED TRANSFERS INQUIRY
- SCHEDULED TRANSACTIONS INQUIRY

The Scheduled Transactions screen is described in section 29.

Scheduled Transfer Detail screen — Displays the details of a selected future or recurring scheduled transfer transaction. Using this screen, you can update a future or recurring scheduled transfer, delete a future or recurring scheduled transfer, or skip the next transfer period for a recurring scheduled transfer. This screen is displayed when a scheduled transfer transaction is entered and approved. You can also access this screen from the Scheduled Transactions screen to obtain detailed information on a specified scheduled transfer. The Scheduled Transfer Detail screen is described in section 30.

Transaction History screen — Displays summary information of previously completed and currently scheduled BASE24-billpay transactions for a particular customer. From this summary, you can scroll through all of the customer's

previously completed or currently scheduled transactions that have not yet been archived and select to view detailed information on individual transactions by placing the cursor next to a transaction and pressing a function key. The Transaction History Detail screen is then displayed containing all the information recorded for the transaction in the History Table (HIST). You can access the Transaction History screen from the Transaction Menu, the Customer Information screen, the New Payment screen, or the New Transfer screen. The Transaction History screen is described in section 33.

Transaction History Detail screen — Displays detailed information about a transaction selected on the Transaction History screen. This display includes all the information recorded for the transaction in the History Table (HIST). This screen is accessed from the Transaction History screen. The Transaction History Detail screen is described in section 34.

Vendor Detail screen — Displays detailed information for a particular vendor and vendor branch selected on the Vendor Registry screen. The Vendor Detail screen is described in section 37.

Vendor Registry screen — Enables you to search for vendors already registered to the system when adding a customer vendor on behalf of a customer. Using this screen, you can search for registered vendors by entering a full or partial vendor name. In addition, you can also specify the following criteria for the search: whether all branches or just the main branch for the vendor are returned, whether only currently active vendors or all vendors are returned, whether only verified vendors are returned, and whether all vendors (both public and limited) or only public vendors are returned. Information for up to three vendors can be displayed on the screen at one time. You can then select a particular vendor and return the information to the Customer Vendor Detail screen. This screen is accessed using a function key from the Customer Vendor Detail screen. The Vendor Registry screen is described in section 38.

CSR Screen Functions and Relationships

This subsection describes each of the following CSR screen functions and shows you the screen hierarchy and access relationships that exist among the screens for each function:

- Verifying customers
- Selecting transactions
- Performing BASE24-telebanking transactions
- Performing BASE24-billpay transactions

A series of diagrams is provided that visually depicts the order in which screens are accessed to perform specific transactions or functions. In these diagrams, the arrows depict the direction of access. Arrows are always directed from the source screen to the destination screen or function. An arrow with a dotted line indicates a screen from which information can be selected and returned to the source screen or to another screen.

Verifying Customers

Each customer that calls must be verified before access to the customer's ID is allowed. This can include verifying the customer's identity and personal identification number (PIN). The only exceptions to this are when you are signing up a new customer for BASE24-billpay service or entering a loan application on behalf of a customer, in which case, customer verification is not required.

First, obtain the customer's name, customer ID, or an account number, enter it on the Customer Verify Request screen, and press a function key to display the Customer Verify Response screen.

The Customer Verify Response screen is displayed unless one of the following occurs:

- More than one customer has access to the entered customer ID
- A customer name is entered that exactly matches one or more configured customer names or is similar in spelling to one or more configured customer names
- You enter an unknown customer ID, account number, or customer name

For the first two cases above, the Multiple Customer Selection screen may be displayed. You must select an individual customer ID and customer combination on the Multiple Customer Selection screen before the Customer Verify Response screen is displayed. For the last case, an error message is displayed indicating that the entered information is not valid.

For more information on name algorithms, refer to the PIT-NAM-ALGO param description in the *BASE24 Logical Network Configuration File Manual* and to section 3 of this manual. If you misspell the customer name, an error message may be displayed instead, depending on whether your system uses a name algorithm (e.g., Soundex). If you enter a customer ID or an account number that is not configured to the system, an error message is also displayed instead of the Multiple Customer Selection screen.

Next, you must ensure that the customer is authentic. This is accomplished by asking the customer questions about personal information (e.g., government ID, mother's maiden name, and birth date) that only the authentic customer would know.

When the Customer Verify Response screen is displayed, you can ask the customer to provide some or all of the personal information displayed on the screen, according to the customer's financial institution or service provider security requirements. You can also display more detailed personal customer information by pressing a function key on the Customer Verify Response screen to display the Customer Personal Detail screen. If the customer cannot provide the required information on one or both of these screens, access to the customer ID is denied. You can then terminate the call or transfer the caller for security processing, according to the policies of your organization.

If PIN verification is required, the customer's PIN must be verified before any other transaction can be performed. A screen is provided that enables you to enter the customer PIN and verify it. If the PIN provided by the customer matches that stored for the customer ID, access to the customer ID is allowed. If the PIN provided by the customer does not match the PIN stored for the customer ID, you can ask the customer to provide the PIN again, terminate the call, or transfer the caller, according to the policies and procedures of your organization.

If a PIN change is required, the customer PIN must be changed before any other transaction can be performed. A screen is provided that enables you to enter the new PIN and confirm it with the customer.

If both a PIN change and PIN verify transaction are required, the PIN must be changed before it can be verified.

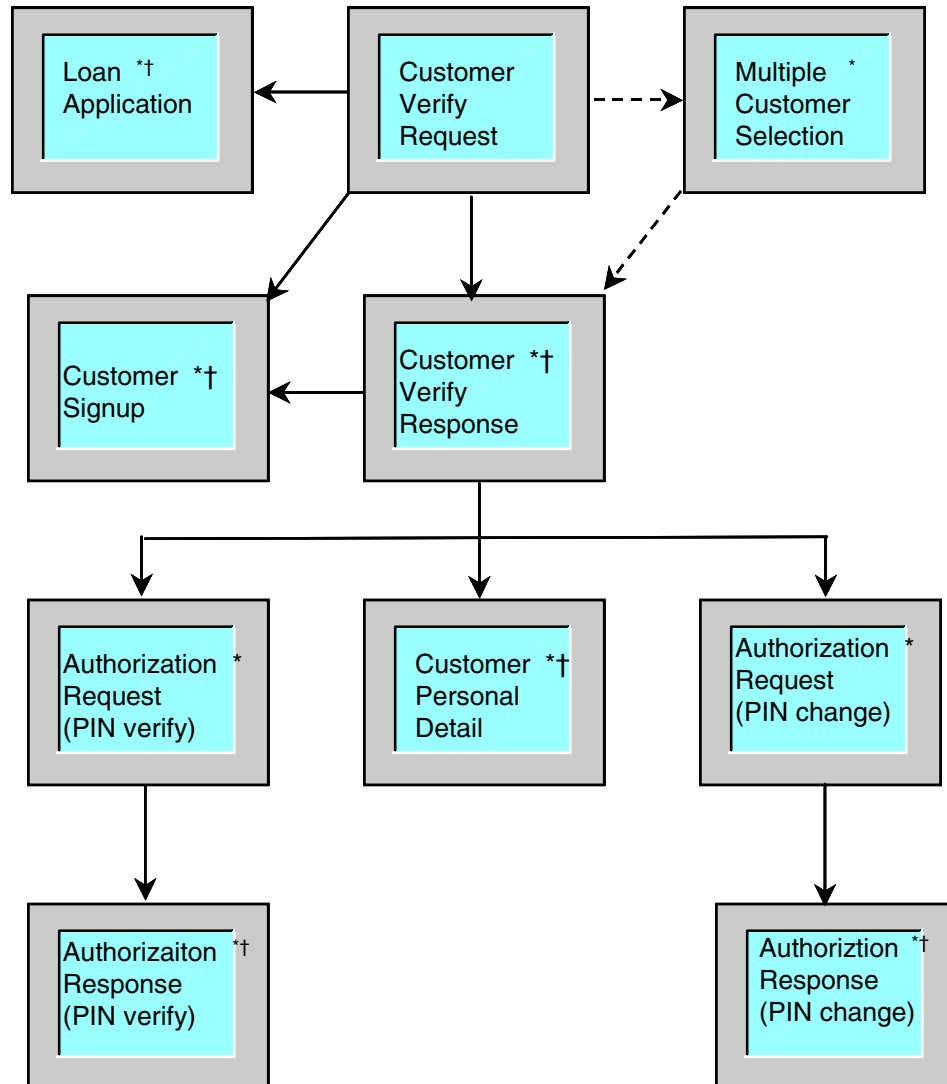

Once the customer is successfully verified, you can display a menu that enables you to select the transactions the customer wants to perform.

From almost every CSR screen, you can return to the Customer Verify Request screen by pressing a function key to begin verification processing for the next customer.

Brief introductions to each of the customer verification screens are provided earlier in this section. Refer to section 3 of this manual for step-by-step procedures for performing customer verification.

Customer Verification Screen Relationships

The following diagram depicts the relationships that exist among CSR screens used to perform customer verification.

*Allows access to the Cusotmer Verify Request screen

†Allows access to the Transaction Menu

Selecting Transactions

Once a customer is verified, you can select the transactions the customer wants to perform. The Transaction Menu displays all the available BASE24-telebanking and BASE24-billpay transactions you can perform at a CSR terminal on behalf of the customer. After you select a transaction on this screen, either the Transaction Selection screen or the initial screen required to perform the transaction is displayed. The Transaction Selection screen is displayed only if more than one account type is configured for the selected transaction in the Processing Code Definition File (PCDF). The Transaction Selection screen enables you to select the account types on which certain BASE24-telebanking transactions are to be performed. Once you select the account types on this screen, the initial screen required to perform the transaction is displayed.

When the initial screen required to perform the selected transaction is displayed, you can then enter the specific information required for the transaction on this screen and on any subsequent screens displayed to complete the transaction. For all transactions that are performed on a specific account or accounts, fields and screens are provided that allow you to select the account or accounts on which the transaction is to be performed.

From nearly all CSR screens, you can return to the Transaction Menu by pressing a function key to begin processing another transaction on behalf of the same customer, or return to the Customer Verify Request screen by pressing a function key to begin processing the next customer call.

From BASE24-telebanking transaction response screens, you can return to the Transaction Selection screen by pressing a function key to perform the same transaction on different account types.

Performing BASE24-telebanking Transactions

When you select a BASE24-telebanking transaction from the Transaction Menu, either the Transaction Selection screen or the appropriate Authorization Request screen is displayed.

The Transaction Selection screen enables you to specify the account types on which the transaction is to be performed before the Authorization Request screen is displayed. For many customers, the system can determine the exact account on which a transaction is to be performed with just the account type. This saves you the time of having to obtain and enter an account number or account qualifier when performing the transaction. When you attempt to authorize a transaction and the customer has two or more accounts with the same account number or account type,

and multiple account selection is enabled, you are presented with a list of the customer accounts on the Account Selection screen when you attempt to authorize the transaction. You can then select the specific account on which the transaction is to be performed on this screen.

When the Authorization Request screen is displayed for a BASE24-telebanking transaction, the fields displayed on the screen are specific to the transaction requested. After entering the required information and any desired optional information for the transaction, you press a function key to authorize the transaction. When the system responds, one of the following response screens or the Account Selection screen is displayed. The specific type of response screen displayed depends on whether the transaction was approved or denied and the type of information requested in the transaction.

- The Account List Inquiry Response screen displays all of the accounts configured for a customer ID in the system for approved customer account list inquiry transactions.
- The Account List Inquiry with Balances Response screen displays the available balance or credit for all of the accounts configured for a customer ID in the system for approved account list inquiry with balances transactions.
- The Authorization Response screen displays the reason why a transaction was approved or denied. It also displays balance information for approved available funds inquiry transactions and some PIN verify transactions.
- The Check Stop Payment Add Response screen displays the result of a check stop payment add transaction.
- The Last Transaction Response screen displays transaction information for approved historical transaction inquiry transactions.
- The Statement Closing Download Response screen displays closing statement information.
- The Statement Download Response screen displays a statement of transactions for a specified period.

The following table shows you all the reserved BASE24-telebanking transactions (provided in default Transaction Type by Source Code (TTSC) rows) that can be selected from the Transaction Menu and the initial screen displayed when the transaction is selected. Subsequent screens can then be accessed as required to complete the requested transaction.

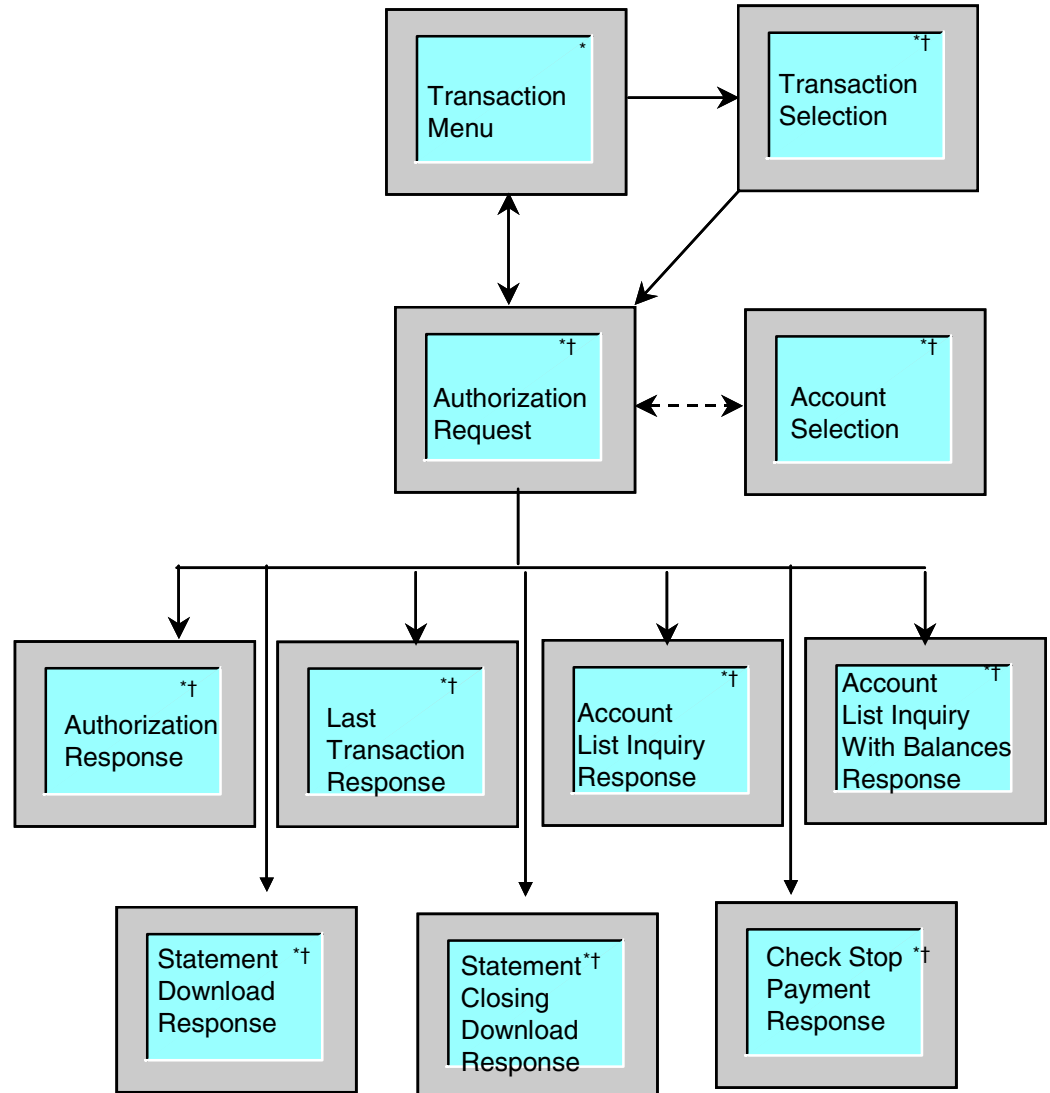

Transaction	Initial Screen Displayed
ACCOUNT LIST INQUIRY	Authorization Request screen 1 (account list inquiry/account list inquiry with balances)
ACCOUNT LIST INQ WITH BALANCES	Authorization Request screen 1 (account list inquiry/account list inquiry with balances)
AVAILABLE FUNDS INQUIRY	Transaction Selection screen 1 *
CHECK CLEARANCE INQUIRY	Transaction Selection screen 1 *
CHECK STOP PAYMENT ADD	Transaction Selection screen 1 *
LAST COUNT CHECK INQUIRY	Transaction Selection screen 1 *
LAST COUNT SOURCE INQUIRY	Transaction Selection screen 1 *
LAST COUNT TRANSFER INQUIRY	Transaction Selection screen 1 *
LAST COUNT CREDIT INQUIRY	Transaction Selection screen 1 *
LAST COUNT DB/CR INQUIRY	Transaction Selection screen 1 *
LAST COUNT DEBIT INQUIRY	Transaction Selection screen 1 *
STATEMENT CLOSING DOWNLOAD INQUIRY	Transaction Selection screen 1 *
STATEMENT DOWNLOAD INQUIRY	Transaction Selection screen 1 *
PIN CHANGE	Authorization Request screen 1 (PIN change)
PIN VERIFY	Authorization Request screen 1 (PIN verify)
TRANSFER IMMEDIATE	Transaction Selection screen 1 *

- * The Transaction Selection screen is displayed only if more than one account type has been configured for this transaction in the PCDF. Otherwise, the Authorization Request screen is displayed.

Brief introductions to each of the BASE24-telebanking screens are provided earlier in this section. Refer to section 3 of this manual for step-by-step procedures for performing BASE24-telebanking transactions.

BASE24-telebanking Transaction Screen Relationships

The following diagram depicts the relationships that exist among CSR screens used to perform BASE24-telebanking transactions.

* Allows access to the Customer Verify Request screen

† Allows access to the Transaction Menu

Performing BASE24-billpay Transactions

When a BASE24-billpay transaction is selected from the Transaction Menu, the initial screen required to perform the transaction is displayed. The screens displayed vary according to the transaction selected. The following table shows all the reserved BASE24-billpay transactions (provided in default TTSC rows) that can be selected from the Transaction Menu and the initial screen displayed when the transaction is selected. Subsequent screens may then be accessed as required to complete the requested transaction. Brief introductions to each of the BASE24-billpay CSR screens are provided earlier in this section. Refer to section 3 of this manual for step-by-step procedures for performing BASE24-billpay transactions.

Transaction	Initial Screen Displayed
BANK BRANCH LIST INQUIRY	Customer Information screen 1
BANK LIST INQUIRY	Customer Signup screen 1
CUSTOMER ACCOUNT ACTIVATE	Customer Information screen 1
CUSTOMER ACCOUNT ADD	Customer Information screen 1
CUSTOMER ACCOUNT DEACTIVATE	Customer Information screen 1
CUSTOMER ACCOUNT DELETE	Customer Information screen 1
CUSTOMER ACCOUNT UPDATE	Customer Information screen 1
CUSTOMER ACTIVATE	Customer Information screen 1
CUSTOMER ADD	Customer Signup screen 1
CUSTOMER DEACTIVATE	Customer Information screen 1
CUSTOMER INQUIRY	Customer Information screen 1
CUSTOMER UPDATE	Customer Information screen 1
CUSTOMER VENDOR ACTIVATE	Customer Vendor Detail screen 1
CUSTOMER VENDOR ADD	Customer Vendor Detail screen 1

Transaction	Initial Screen Displayed
CUSTOMER VENDOR DEACTIVATE	Customer Vendor Detail screen 1
CUSTOMER VENDOR INQUIRY	Customer Vendor Detail screen 1
CUSTOMER VENDOR MASK VRFY INQ	Customer Vendor screen 1
CUSTOMER VENDOR REQUEST MAIL	Customer Vendor Detail screen 1
CUSTOMER VENDOR UPDATE	Customer Vendor Detail screen 1
HISTORY INQUIRY – ALL TRANS	Transaction History screen 1
HISTORY INQUIRY – PMNTS/ XFERS	Transaction History screen 1
LOAN APPLICATION	Loan Application screen 1
MASTER VENDOR ADD	Customer Vendor Detail screen 1
MASTER VENDOR LIST INQUIRY	Customer Vendor Detail screen 1
MISCELLANEOUS REQUEST	Miscellaneous Request screen 1
MISCELLANEOUS REQUEST INQUIRY	Miscellaneous Request screen 1
SCHEDULED PAYMENT DELETE	Scheduled Transactions screen 1
SCHEDULE PAYMENT – FUTURE	New Payment screen 1
SCHEDULE PAYMENT – IMMEDIATE	New Payment screen 1
SCHEDULE PAYMENT – RECURRING	New Payment screen 1

Transaction	Initial Screen Displayed
SCHEDULED PAYMENT UPDATE	Scheduled Transactions screen 1
SCHEDULED PAYMENTS INQUIRY	Scheduled Transactions screen 1
SCHEDULE TRANSFER – FUTURE	New Transfer screen 1
SCHEDULE TRANSFER – RECURRING	New Transfer screen 1
SCHEDULED TRANSFER DELETE	Scheduled Transactions screen 1
SCHEDULED TRANSFER UPDATE	Scheduled Transaction screen 1
SCHEDULED TRANSACTIONS INQUIRY	Scheduled Transactions screen 1
SCHEDULED TRANSFERS INQUIRY	Scheduled Transactions screen 1

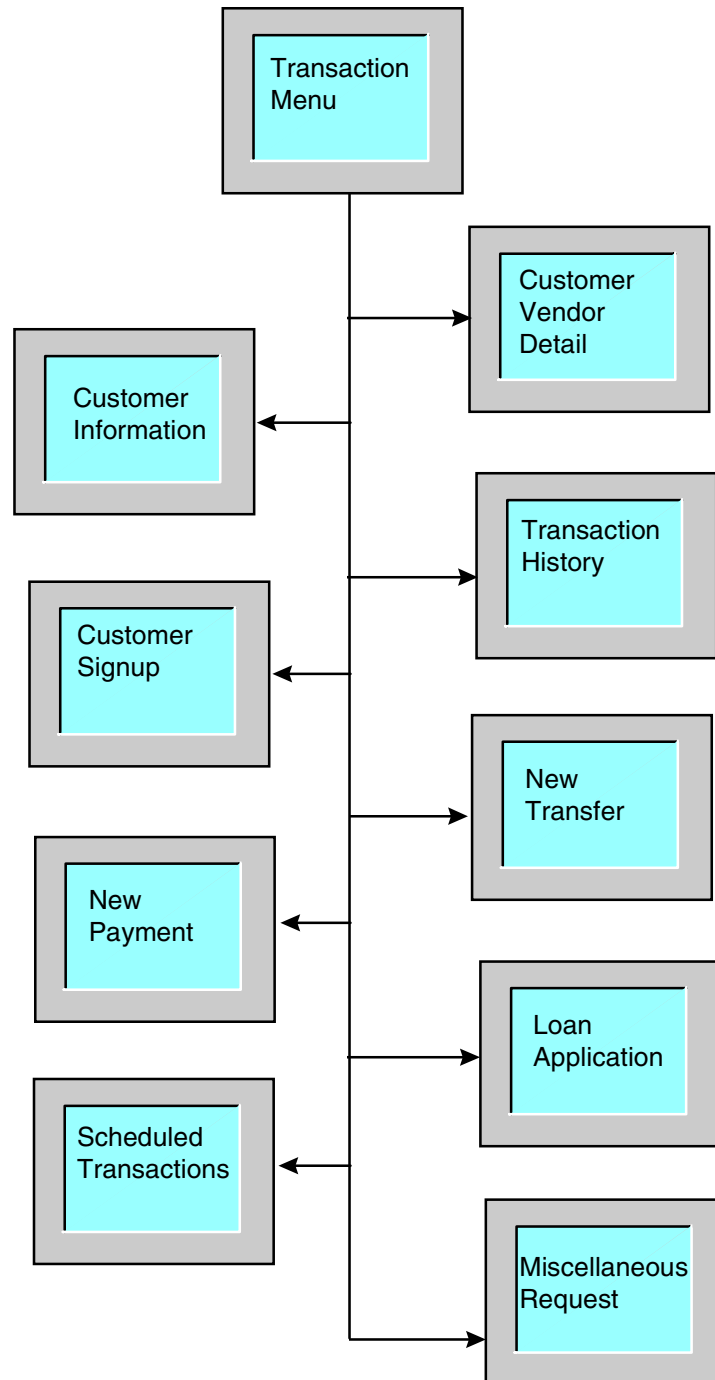

BASE24-billpay Transaction Screen Relationships

The following diagrams depict the relationships that exist among CSR screens used to perform BASE24-billpay transactions. Customer verification must be completed before any BASE24-billpay transactions can be performed, except when signing up a new BASE24-billpay customer or when entering a loan application on behalf of the customer.

The first diagram shows you the initial screens that are accessed directly from the Transaction Menu.

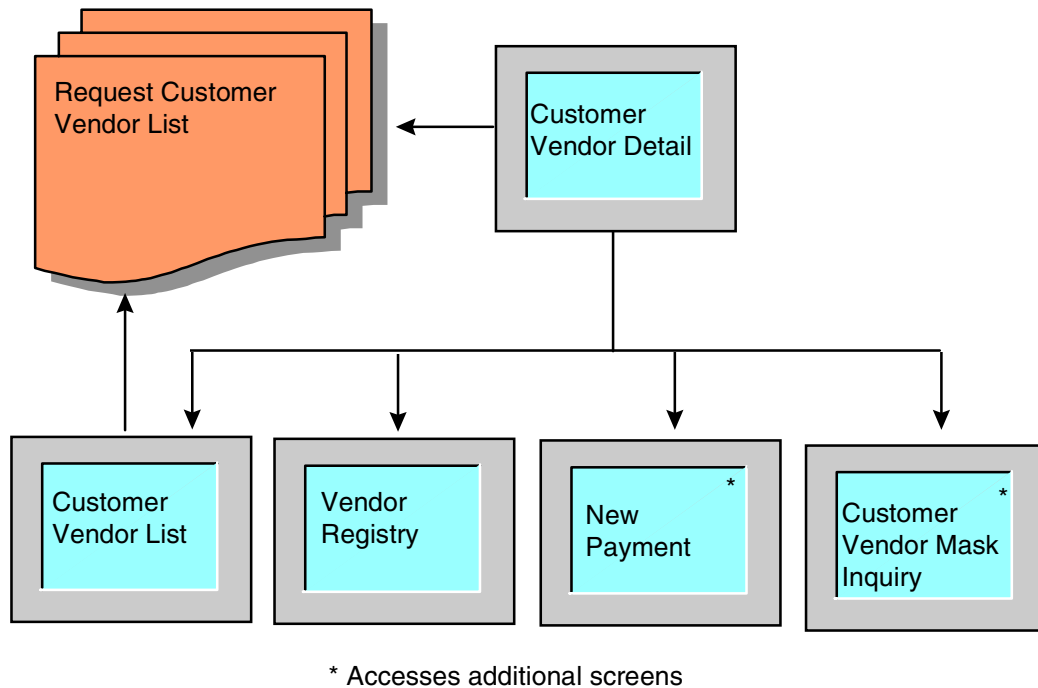

Note: If you access the Customer Signup screen from the Transaction Menu, you can use the screen only to activate currently configured customers. When signing up new customers, you must access the Customer Signup screen from the Customer Verify Request screen.

The remaining diagrams in this section depict the screen relationships that exist after each of these initial screens is accessed. All BASE24-billpay screens allow direct access to the Customer Verify Request screen and Transaction Menu using function keys.

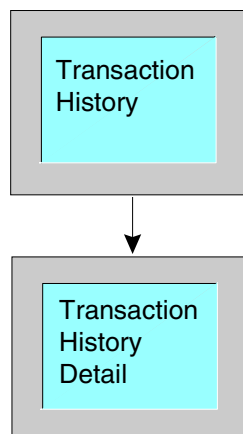

Customer Vendor Detail Screen Relationships

The following diagram shows you the screen and function relationships that exist after the Customer Vendor Detail screen is displayed.

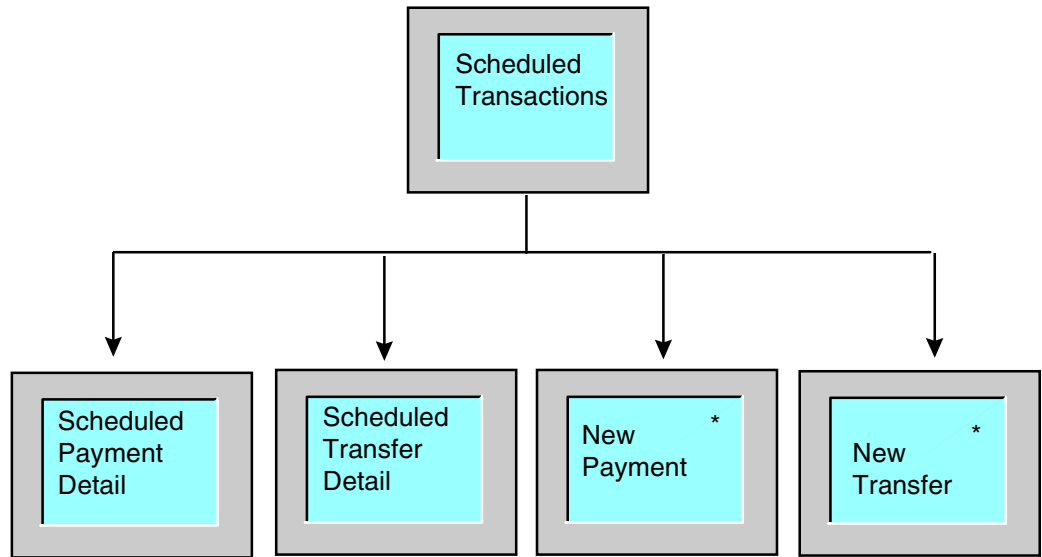

Transaction History Screen Relationships

The following diagram shows you the screen relationship that exists after the Transaction History screen is displayed.

Scheduled Transactions Screen Relationships

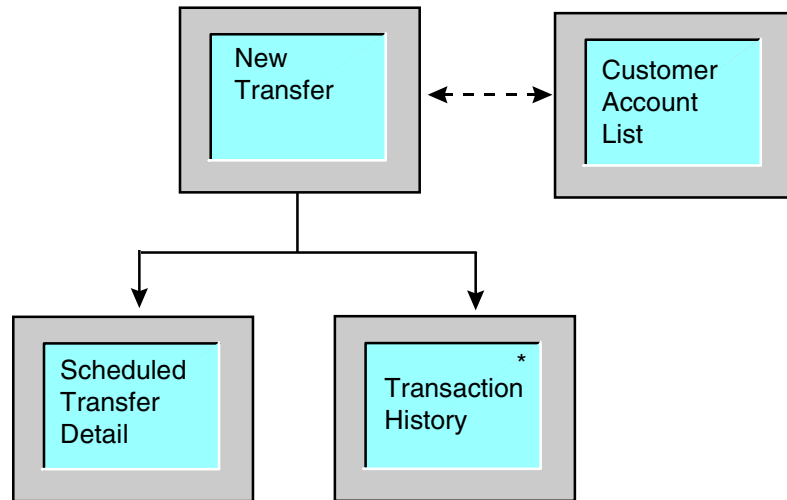

The following diagram shows you the screen relationships that exist after the Scheduled Transactions screen is displayed.

* Accesses additional screens

New Transfer Screen Relationships

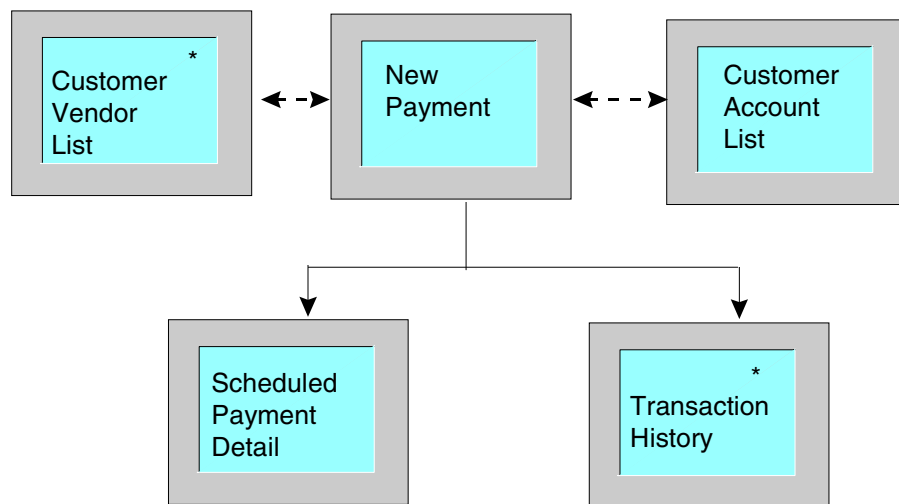

The following diagram shows you the screen relationships that exist after the New Transfer screen is displayed.

* Accesses additional screens

New Payment Screen Relationships

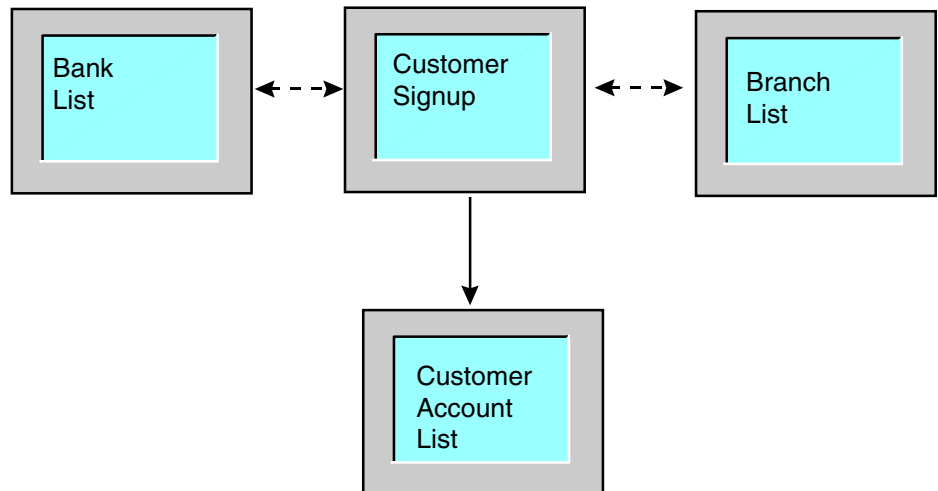

The following diagram shows you the screen relationships that exist after the New Payment screen is displayed.

*Accesses additional screens or functions

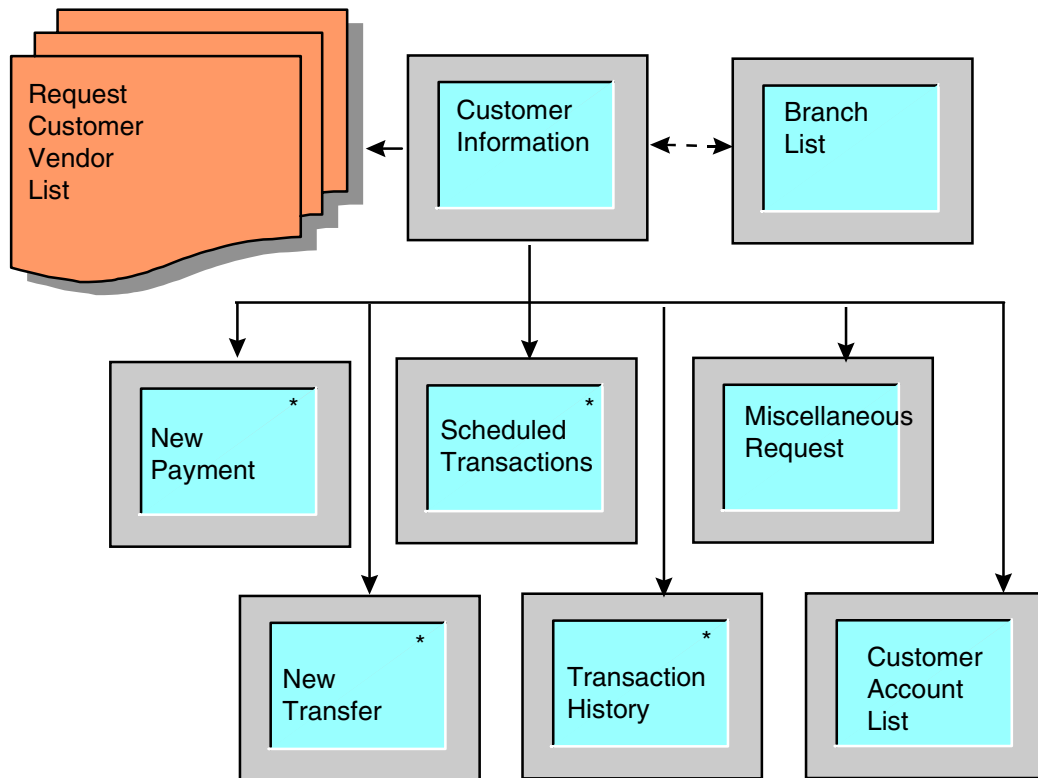

Customer Signup Screen Relationships

The following diagram shows you the screen relationships that exist after the Customer Signup screen is displayed.

Customer Information Screen Relationships

The following diagram shows you the screen relationships that exist after the Customer Information screen is displayed.

* Accesses additional screens or functions

Loan Application and Miscellaneous Request Screen Relationships

No additional screens other than the Customer Verify Request screen and the Transaction Menu can be accessed from either the Loan Application or Miscellaneous Request screens.

CSR Function Keys

In order to display CSR screens, enter, update, or delete data in fields, or execute specific functions, you must press various function keys on the CRT terminal keyboard. CSR function keys allow you to perform functions such as: selecting screen information; accessing another screen; adding, updating, or deleting transaction information; entering or canceling a transaction; activating or deactivating a customer ID; and requesting a Customer Vendor List to be printed for mailing to a customer.

The function keys used on CSR screens are described below. While there are exceptions to the use of these function keys, the functions described here are considered the standard. Any exceptions are described in the documentation for the applicable screens. If function keys are not explained for a particular screen, these standard definitions apply.

Throughout BASE24 product manuals, references to these function keys include only BASE24 function keys. Specific keyboards can require the use of a combination of keys to achieve the functionality.

The first column of information below shows the BASE24 keys. The second column describes the functions that can be accomplished with these function keys.

Key	Description
F1	Select — Selects the item or information displayed at the cursor prompt or specified in a selection field. On some screens, this key may also cause the selected information to be returned and displayed on the previous screen accessed. On other screens, this key is used to request detailed information to be displayed for the selected item.
F2	Change Customer — Displays the Customer Verify Request screen. This function enables you to stop processing for the current customer in preparation for the next customer. This function is available on every CSR screen.
F3	PIN Verify — Initiates a PIN verify transaction after you have entered the customer's PIN. This function is only supported from the customer verification screens.

Key	Description
F4	Transaction Menu — Displays the Transaction Menu. This menu enables you to select a transaction to be performed.
F5	Enter Transaction — Enters or submits a particular transaction using the information currently displayed on the screen, or executes a particular function such as adding information to a table. Text identifying the specific transaction or function initiated by this function key is displayed at the bottom of the screen and on help screens.
F6	Cancel (Delete/Deactivate) — Cancels the previously entered and approved transaction, deletes a specified scheduled transaction, or deactivates a customer ID. Successful cancellation of a financial transaction causes the transaction to be reversed. Note: Denied transactions cannot be canceled. In addition, to cancel an approved nonfinancial transaction, the customer's financial institution must allow nonfinancial transactions to be canceled.
F7	Change Account — Displays the Transaction Selection screen. This screen displays all possible transaction and account type combinations configured to the system for the selected BASE24-telebanking transaction. This enables you to perform the same transaction again using a different account type.
F8	Update — Updates configured system information with the information currently displayed on the screen.
F9	Next Page — Displays the next page of a multipage screen. If you are on the last page of the screen, this function displays the first page.
F10	Print Screen — Sends the screen currently displayed for printing to the spooler location indicated on the BASE24 Logon screen.
F11	Previous Page — Displays the previous page of a multipage screen. If you are on the first page of the screen, this key displays the last page of the screen.

Key	Description
F12	Help — Displays the help screen for the current screen. The help screens for CSR screens list all the functions performed by the function keys available on that particular screen.
F15	Activate — Activates a BASE24-billpay customer ID, customer account, or customer vendor. This function changes the verification status of the customer ID, customer account, or customer vendor to a value of Verified, the begin date to the current system date, and the end date to a nonexpiring value. A customer ID, customer account, or customer vendor cannot be used in financial transactions until after the appropriate customer information has been verified and the current system date is equal to or greater than the begin date, and less than or equal to the end date.
F16	Return — Displays the previously accessed CSR screen or menu. If you are working on the Customer Verify Request screen when you perform this function and you accessed this screen from the Core Product Menu, the Core Product Menu is displayed. If you accessed the current screen directly from the Transaction Menu, this function exits the CSR screens completely and displays a product menu or the Virtual Menu. If you are viewing a help screen for a BASE24-billpay screen when you perform this function, you are returned to the screen from which you accessed the help screen. On all BASE24-telebanking CSR screens and associated help screens, this function can also be used to move you to a new screen outside of the CSR screens, but only if you have security access to that screen. To move to a new screen, enter the appropriate screen acronym (e.g., CSTT for the Customer Table screen) in the FILE DESTINATION field before pressing this key. The FILE DESTINATION field is not displayed on BASE24-billpay CSR screens.
Shift-F1	New Payment — Displays the New Payment screen. This screen enables you to enter an immediate, recurring, or future scheduled payment on behalf of a customer.

Key	Description
Shift-F2	New Transfer — Displays the New Transfer screen. This screen enables you to enter a recurring or future scheduled transfer on behalf of a customer.
Shift-F4	Select From Account — Enables you to select an account from which a transfer or payment is to be made.
Shift-F5	Select To Account — Enables you to select an account to which a transfer is to be made.
Shift-F6	Transaction History — Displays the Transaction History screen. This function is accessed from the Customer Information, New Payment, and New Transfer screens. or Skip Recurring — Enables you to skip the next scheduled payment or transfer for a recurring scheduled transaction on behalf of a customer. This function is accessed from the Scheduled Payment Detail, Scheduled Transfer Detail, and Scheduled Transactions screens.

Key	Description
Shift-F7	Previous — Retrieves the previous row or rows stored in a table based on the selected key path. On screens that display lists, this function scrolls to the previous page of list entries. The selected key path refers to the field on the screen that the system uses to search for the previous row or rows. If a screen's data is automatically read upon entry to the screen, then the screen has one key path that becomes the selected key path by default. If a screen allows you to enter data to read rows, then the data entry field used in conjunction with the Shift-F8 keys determines the selected key path. You must press the Shift-F8 keys at least once using one of these data entry fields to select the key path before you can use the Shift-F7 keys. If a screen allows you to select among multiple key path fields, then you can use only one key path field at a time. In addition, any data entry fields used to select the key path must be blank when you press the Shift-F7 keys. Each time you press the Shift-F7 keys, the system retrieves the previous row or rows with a value less than the key path field value of the first entry currently displayed on the screen. The current key path remains in force until you change it using the Shift-F8 keys and one of the data entry fields. For each screen that uses the Shift-F7 keys, the function key description for that screen section indicates the default key path used or the key path fields available on that screen.

Key	Description
Shift-F8	Next — Retrieves the next row or rows stored in a table based on the selected key path. On screens that display lists, this function scrolls to the next page of list entries. The selected key path refers to the fields on the screen that the system uses to retrieve the next row or rows. If a screen's data is automatically read upon entry to the screen, then the screen has one key path that becomes the selected key path by default. You can press the Shift-F8 keys immediately on these screens to retrieve the next row or rows. If a screen allows you to enter data to read rows, then a data entry field used in conjunction with the Shift-F8 keys determines the selected key path. The selected key path remains in force until you enter a different value in a key path field and press the Shift-F8 keys again. If a screen allows you to select among multiple key path fields, then you can use only one key path field at a time. When you select a key path field using the Shift-F8 keys, the system searches for the next row or rows with a value greater than the entered key path field value. Each time you subsequently press the Shift-F8 keys using the default key path or the same selected key path, the system retrieves the next row or rows with a value greater than the key path field value of the last entry currently displayed on the screen. For each screen that uses the Shift-F8 keys, the function key description for that screen section indicates the default key path used or the key path fields available on that screen.
Shift-F9	Request Customer Vendor List — Requests that the Customer Vendor List be printed for a specified customer. The printed list can then be mailed to the customer. This function can be accessed from the Customer Information, Customer Vendor Detail, or Customer Vendor List screens.

Key	Description
Shift-F16	Logoff — Logs you off the BASE24 CRT access system. If you are currently accessing a CSR screen, this function returns you to a blank BASE24 Logon screen. If you are currently accessing a BASE24 menu or the BASE24 Logon screen, this function either redisplay the BASE24 Logon screen or returns you to the TACL prompt, depending on how the terminal is configured. Note: IBM 327X-series terminals exit only to the BASE24 Logon screen; these terminals cannot exit to a TACL prompt unless configured to do so in the RQMEGA compile file. Only those IBM 327X-series terminals used with an emulation package that enables the terminals to be directly connected to the Tandem can be configured to exit to a TACL prompt.

Help Screens

BASE24 products supply online Help screens that list the function keys that apply on each screen. The Help screens are displayed by pressing the **F12** key.

Help screens are not available for the BASE24 Logon screen or the Virtual Menu. However, the function keys that are available on these screens are listed at the bottom of the screens.

BASE24-telebanking Help Screens

When you are accessing the help screen for a BASE24-telebanking CSR screen, you must press one of the function keys listed at the bottom of the screen to return to the screen from which you accessed the help screen.

An example of the Help screen for the BASE24-telebanking Customer Verify Request screen is shown below.

```
BASE24-CORE   CSR CONTROL                LLLL          YY/MM/DD  hh:mm  01 OF 01

```

CSR Processing Controls and Reporting

This subsection describes information that controls or reports processing of transactions entered from a CSR terminal.

Allowed Transaction Checking

For each transaction you initiate, the BASE24-telebanking or BASE24-billpay software checks the appropriate file or table to determine whether the transaction is allowed from a CSR terminal, whether the customer's financial institution allows the transaction, and whether the customer is allowed to perform the transaction.

First, the Transaction Types by Source Code Table (TTSC) is checked to ensure that you are allowed to perform the transaction from a CSR terminal. Next, the Processing Code Definition File (PCDF) is checked to ensure that the customer's financial institution allows the transaction. Finally, the Customer Allowed Transaction Type Table (CATT) is checked to ensure that the customer can perform the transaction.

In addition to the above, the Institution Definition File (IDF) is checked to determine whether you are required to verify a customer's PIN and allowed to change a customer's PIN.

For detailed information on how the system uses these files and tables to determine whether a transaction is allowed, refer to the ***BASE24 Remote Banking Transaction Processing Manual***.

CSR Reports

CSR activity can generate several reports. Most of these reports should be scheduled to be generated on a daily basis at a convenient time after logical network cutover. Two exceptions are the Customer Vendor Year End Summary and the Master Vendor Report, which are generated on an as-needed basis. The following CSR reports should be generated on a daily basis:

- Customer Notice
- Customer Vendor List
- Loan Application

- Miscellaneous Request
- New Customer

Refer to the ***BASE24 Remote Banking End-of-Period Processing and Reporting Manual*** for detailed descriptions of these reports and how they are generated.

CSR Screen Security

CSR screens use standard BASE24 CRT access security; however, only the CSRC entry is entered into the file and table security record. The BASE24 CRT access system enables financial institutions to establish individual user access restrictions for each employee using security records. Security records define what system entities you can access, when you can access the system, which files and tables you can access, which terminals you can use, and what functions you can perform.

In addition to file and table restrictions, time restrictions, and institution restrictions, you can also be restricted from database maintenance functions such as reading, adding, updating, and deleting file records or table rows. For example, you may be permitted to read and update file records or table rows, while being restricted from adding or deleting file records or table rows. Because only the CSRC entry is used, the same database maintenance function restrictions apply to all of the CSR screens.

Note: The User/FIID Relation File (UFIR) enables users to restrict the financial institutions (FIIDs), regions, and branches you can access. The BASE24-telebanking and BASE24-billpay products do not use user/FIID security. For both products, you can access and perform transactions for any customer, regardless of whether or not you have user/FIID security to the customer's data in the UFIR.

For more information on BASE24 CRT access security, refer to the ***BASE24 CRT Access Manual***.

LCONF Params

The following Logical Network Configuration File (LCONF) params directly impact how the CSR screens are used. Your supervisor should be able to tell you how each of these params are set for your system and how they impact your use of CSR screens. Refer to the ***BASE24 Logical Network Configuration File Manual*** for detailed descriptions of these params.

- BP-ACH-PAID-DAYS
- BP-ARCHIVE-BY-SYSTEM-DAYS
- BP-ACQ-FIID

Multiple Account Selection

To enable multiple account selection for CSR screens, the following must be true:

- The multiple account select index on the Customer/Account Relation Table (CACT) must be enabled.
- The MULTIPLE ACCOUNT SELECT timer field on the VRU Configuration Data (VCD) screen 18 must be set to a nonzero value for the Customer Service Interface (CSI).
- The MULTIPLE ACCOUNT SELECT DISPLAY field on screen 40 of the Institution Definition File (IDF) should be set to an appropriate value for the preferred way in which the Account Selection screen is displayed to customer service representatives for each financial institution.

Refer to the ***BASE24 Core Files and Tables Maintenance Manual*** for more information on the CACT and VCD. Refer to the ***BASE24 Base Files Maintenance Manual*** for more information on the IDF.

OMF Usage

Because CSR screens allow functions similar to those available on file and table maintenance screens, CSR activities are logged to the Online Maintenance File (OMF) just as they would be for file and table maintenance screens. Actions that add, update, or delete rows in the following tables are logged to the OMF:

- Customer Table (CSTT)
- Customer/Account Relation Table (CACT)
- Customer Billpay Table (CBPT)
- Customer/Personal ID Relation Table (CPIT)
- Customer Vendor Table (CVND)
- History Table (HIST)
- Personal Information Table (PIT)
- Service Provider Table (SVPT)
- Vendor Branch Table (VNDB)
- Vendor Table (VNDR)

Transaction Logging

Most transactions you perform using CSR screens are logged in the appropriate log file or table. The exceptions are noted below. BASE24-telebanking transactions are logged to the ITS Transaction Log File (ITLF), while BASE24-billpay transactions are logged to the History Table (HIST). Some BASE24-billpay transactions are logged to both the HIST and the ITLF.

Refer to sections 30 and 31 for a list of all BASE24-billpay transactions logged to the HIST. The payment – immediate transaction, which authorizes the debit of the customer's *from* account for a schedule payment – immediate transaction, is not logged to the HIST.

The BASE24-telebanking customer verify and customer select transactions are not logged to the ITLF. The customer verify transaction is performed when you press the **F2** key on the Customer Verify Request screen. The customer select transaction is performed when you select a customer on the Customer Selection screen.

CSR Table and File Usage

Information displayed on CSR screens or accessed by the CSR transaction processing software is obtained from various database SQL tables and Enscribe files. Related data stored in an SQL table is referred to as a row while related data stored in an Enscribe file is referred to as a record. Records and rows from files and tables are accessed by CSR screens. Refer to the “Enscribe File Record Access” and “SQL Table Row Access” discussions later in this section for detailed information on how CSR screens access data from Enscribe files and SQL tables. The following table shows you the SQL tables and Enscribe files from which data is accessed by CSR screens or transaction processing software. The first column of the table lists the file or table name. The second column of the table provides the name of the manual in which the file or table is described.

File or Table Name	Manual Where Described
Account Type Table File (ATT)	<i>BASE24 Core Files and Tables Maintenance Manual</i>
Bank Table (BANK)	<i>BASE24 Base Files Maintenance Manual</i>
Bank Branch Table (BKBR)	<i>BASE24-billpay Tables Maintenance Manual</i>
Customer Allowed Transaction Table (CATT)	<i>BASE24 Core Files and Tables Maintenance Manual</i>
Customer Billpay Table (CBPT)	<i>BASE24-billpay Tables Maintenance Manual</i>
Customer Table (CSTT)	<i>BASE24 Core Files and Tables Maintenance Manual</i>
Customer/Account Relation Table (CACT)	<i>BASE24 Core Files and Tables Maintenance Manual</i>
Customer/Personal ID Relation Table (CPIT)	<i>BASE24 Core Files and Tables Maintenance Manual</i>
Customer Vendor Table (CVND)	<i>BASE24-billpay Tables Maintenance Manual</i>
Future Table (FUTR)	<i>BASE24 Remote Banking Transaction Processing Manual</i>

File or Table Name	Manual Where Described
History Table (HIST)	<i>BASE24-billpay Tables Maintenance Manual</i>
Institution Definition File (IDF)	<i>BASE24 Base Files Maintenance Manual</i>
Loan Application Table (LOAN)	<i>BASE24 Remote Banking Customer Service Support Manual</i>
Miscellaneous Request Table (MISC)	<i>BASE24 Remote Banking Customer Service Support Manual</i>
Personal Information Table (PIT)	<i>BASE24 Core Files and Tables Maintenance Manual</i>
Positive Balance File (PBF)	<i>BASE24 Base Files Maintenance Manual</i>
Processing Code Definition File (PCDF)	<i>BASE24 Core Files and Tables Maintenance Manual</i>
Recurring Table (RCUR)	<i>BASE24 Remote Banking Transaction Processing Manual</i>
Response Text Table (RTXT)	<i>BASE24-billpay Tables Maintenance Manual</i>
Service Provider Table (SVPT)	<i>BASE24-billpay Tables Maintenance Manual</i>
Transaction Type by Source Code Table (TTSC)	<i>BASE24 Core Files and Tables Maintenance Manual</i>
Transaction History File (THF)	<i>BASE24 Remote Banking Transaction Processing Manual</i>
Vendor Mask Table (VNDM)	<i>BASE24-billpay Tables Maintenance Manual</i>
Vendor Table (VNDR)	<i>BASE24-billpay Tables Maintenance Manual</i>
Vendor Branch Table (VNDB)	<i>BASE24-billpay Tables Maintenance Manual</i>

Enscribe File Record Access

Access to Enscribe file records from CSR screens is provided through the use of primary and alternate keys. For all types of Enscribe files, primary keys define the primary fields for which data must be supplied to read a particular record in a file. For key-sequenced Enscribe files, primary key fields are defined by the user or system designer using the Data Definition Language (DDL). For relative Enscribe files, the primary key is the relative record number. For entry-sequenced Enscribe files, the primary key is the record address maintained by Enscribe. In addition to the primary keys, alternate keys can also be used to access Enscribe file records. Alternate keys define an alternative set of fields that can also be used to read a particular record in a file. There is always only one primary key to a file, while there can be a limited number of alternate keys to provide alternative means of access.

Primary and alternate keys are used both when accessing file records from a file maintenance or CSR screen as well as when accessing file records from the BASE24 transaction processing software.

On file maintenance screens, the primary and alternate key fields for a file are always identified in the introductory text for the screen exactly as they appear on the screen. Valid values must be entered in each of the primary or alternate key fields when attempting to read a particular record from a file maintenance screen. When attempting to read the next record in a file, no data or only partial data can be entered in the key fields. If no data is entered in the key fields, the first record in the file is read. If partial data is entered, the next record in the file is read.

On CSR screens from which you can read records, primary and alternate key fields are also used to read records from a file. These fields are typically provided in the customer header fields displayed in all capital letters on lines 3 and 4 of CSR screens. If any additional fields are required to read file records from a CSR screen, these fields are typically displayed near the top of the screen body.

For BASE24 transaction processing software programs, including file maintenance and CSR requesters and servers, the Data Definition Language (DDL) field names associated with the primary and alternate key fields are used to access file records. The DDL field names for each field appearing on a file maintenance or CSR screen are provided with the “Data Name:” caption in each field description. If a screen field does not have a corresponding Enscribe DDL field name, “Not applicable” appears after this caption.

SQL Table Row Access

Access to Structured Query Language (SQL) table rows from CSR screens is provided through the use of primary keys and indexes. For key-sequenced SQL tables, primary keys define the primary columns for which data must be supplied to read a particular row in a table. For relative SQL tables, the primary key is the relative row number. For entry-sequenced tables, the primary key is the row address maintained by SQL. In addition to primary keys, SQL tables can also use indexes to access table rows. Indexes define an alternative set of columns that can also be used to read a particular row or set of rows in a table.

Although SQL table rows can theoretically be accessed using any table row columns, primary keys and indexes provide the high performance data access capabilities required in an online transaction processing system. There is always only one primary key to a table, while there can be a limited number of indexes to provide alternative means of access. All defined indexes are included in the default configuration of SQL tables. Any unwanted indexes can be disabled when the SQL table database is installed, although this should only be done with extreme caution.

Primary keys and indexes are used both when accessing table rows from a table maintenance screen or CSR screen as well as when accessing table rows from the BASE24 transaction processing software.

On table maintenance screens, the primary key and indexed columns are always identified in the introductory text for the screen exactly as they appear on the screen. On table maintenance screens, fields on the screen map directly to table columns where the data entered in the screen field is stored. Valid values must be entered in each of the primary or indexed fields when attempting to read a particular row from a table maintenance screen. When attempting to read the next row in a table, no data or only partial data can be entered in the key or indexed fields. If no data is entered in the key or indexed fields, the first row in the table is read. If partial data is entered, the next row in the table is read.

On CSR screens from which you can read rows, primary and indexed columns are also used to read rows from a table. These fields are typically provided in the customer header fields displayed in all capital letters on lines 3 and 4 of CSR screens. If any additional fields (e.g., QUERY fields) are required to read table rows from a CSR screen, these fields are typically displayed near the top of the screen body.

For BASE24 transaction processing software programs, including table maintenance and CSR requesters and servers, the column names associated with the primary key and indexes are used to access table rows. The column names for

each field appearing on a table maintenance or CSR screen are provided with the “Column Name:” caption in each field description. If a screen field does not have a corresponding SQL column name, “Not applicable” appears after this caption.

Warning: Although Tandem’s Nonstop SQL conversational interface (SQLCI) provided with the NonStop SQL product allows Tandem users to perform ad hoc queries or generate ad hoc reports from SQL tables, such use in a production system may have a detrimental impact on transaction processing performance. Therefore, the improvised use of SQLCI on production SQL tables should be severely restricted or prohibited, and should only be used when required for problem analysis.

ACI Worldwide Inc.

Section 2

Customer Service Terminology

This section defines terms that are basic to understanding the BASE24-telebanking and BASE24-billpay CSR screens. Some of these terms appear as field labels or field values while others need to be understood to use the CSR screens effectively.

The terms in this section are organized according to the following topics:

- Customers
- Vendors
- Accounts
- Transactions
- Billing

Customers

A customer is any individual or business who uses BASE24-telebanking, Enhanced Telebanking, or BASE24-billpay services to manage their bill payment or remote banking needs. Customers can perform remote banking transactions from remote banking devices such as a touch-tone telephone or personal computer, or they can call a customer service representative to perform remote banking transactions on their behalf.

Customer IDs

Each customer is assigned a *customer ID*, which uniquely identifies a remote banking customer to the system. The customer ID is a number from 1–19 characters that is also known as the *primary account number* (PAN). Other BASE24 products use the PAN to identify information on a plastic card. If customers have already been issued plastic cards, existing PANs can be conveniently used as customer IDs; however, the PAN used by the BASE24 Remote Banking products does not have to be associated with a plastic card.

Multiple persons can be associated with a single customer ID or a single person can have access to multiple customer IDs. For example, a business may have a need for several employees to have access to a single customer ID or a single employee to have access to several customer IDs. Access to a customer ID can be secured using a personal identification number (PIN) and by verifying personal information about the calling customer (e.g., mother's maiden name, social security number, etc.).

A customer can have access to an unlimited number of application accounts from his or her customer ID.

When a new customer signs up to use remote banking services, the customer ID may already exist or it is automatically generated by the system when the new customer is added. Customer information for new customers can be preloaded or it must be manually entered when the new customer is signed up. Financial institutions determine whether customer information is preloaded or not. Preloaded customer data is loaded into the BASE24 Remote Banking database from an existing database or tape.

Customer Profiles

A *customer profile* is associated with each customer ID to group the services (i.e., allowed transactions) available for the customer's ID. A customer profile enables financial institutions to associate similar customers with a particular level of service, without redefining all of the allowed transactions for each customer.

Customer Verify Status and Effective Date Range

A verify status and effective date range associated with the customer ID indicate whether the customer ID can be used to perform remote banking transactions. The *verify status* code identifies the status of the customer relationship with his or her financial institution. Valid verify status code values are closed, issued but inactive, and verified. Additional user-defined codes may exist; however, all user-defined codes are treated the same as closed.

You can add application accounts for the customer as long as the verify status is either issued but inactive or verified. You can delete accounts for the customer only when the verify status is issued but inactive.

The customer ID cannot be used to perform transactions unless the verify status is set to verified.

When you activate a customer ID, the verify status is changed from issued but inactive to verified.

When a customer calls to initiate a transaction, the current date must fall within the effective date range before the customer ID can be used in processing.

Customer Session

All activity related to a single customer call using the CSR screens can be referred to as a *customer session*. Each time you verify a different customer, a new session is initiated.

Vendors

A *vendor* is the third party beneficiary in a financial payment transaction (a vendor can also be referred to as the *biller* or *payee*). A *vendor branch* is a particular location for the vendor. For example, a large retailer may have several locations around the world with each location designated as a separate vendor branch. Vendors and vendor branches are used only with the BASE24-billpay product. They are not used with the BASE24-telebanking product or Enhanced Telebanking product modules.

Vendor Registry

All of the vendors configured to the system compose the *vendor registry*, which is also referred to as the *vendor list*. All vendors in the vendor registry can be categorized as public or limited, according to customer usage. A *public* vendor is a vendor to which any customer can make payments. A public utility company, for example, would typically be configured as a public vendor. A *limited* vendor is a vendor that is used by a single or limited number of customers. A personal physician, for example, might be configured as a limited vendor. This categorization of vendors enables the system owner to manage vendors more effectively. However, after a vendor is registered to the system and verified, any customer can make payments to the vendor, regardless of whether the vendor is a public or limited vendor.

Customer Vendors

The vendors to which a particular customer makes payments are referred to as *customer vendors*. The account that is credited when the customer makes a payment to the vendor is known as the customer's *account with vendor*. If a customer makes payments to more than one account with the same vendor, each account relationship with that vendor is defined with a separate customer vendor.

When adding a customer vendor on behalf of a customer, the vendor can be categorized as registered or unregistered, depending on whether the vendor has already been configured to the system. A registered vendor is a vendor that has already been configured to the system. An unregistered vendor is a vendor that has not yet been configured to the system. You can add customer vendors for unregistered vendors only if your organization allows you to do so. If so, the vendor list is considered to be open. If not, the vendor list is considered to be closed.

When a customer vendor is added to the system for a registered vendor, the customer's account with vendor is checked against any vendor masks configured for the vendor and the vendor branch to which payments are sent. A *vendor mask* is an edit that can consist of an account number minimum and maximum length check, account mask matching, or a user-defined algorithm check. Account mask matching checks the entered account number against a template of text and wildcard characters. A vendor can use vendor masks to ensure that all customer account numbers with the vendor are entered in accordance with their own customer account numbering scheme. For more information on vendor masks, refer to the ***BASE24-billpay Tables Maintenance Manual***.

A *budget category* is a code used to group payments to vendors for reporting purposes. For example, a category of UTIL could be used to group all payments a customer makes to vendors for utility services while a category of MRTG could be used to group all payments made to vendors for a home mortgage.

Vendor Remittance

An actual payment made to a vendor is referred to as a *remittance*. Remittances can be in the form of single-item checks, group-item checks, electronic automated clearing house (ACH) payments, or a user-defined type of remittance, as dictated by the vendor.

A *single-item check* is a written order from a single customer's financial institution to pay a vendor an amount from the customer's funds on deposit. A *group-item check* is a written order from multiple customers belonging to the same financial institution to pay a vendor an amount from funds on deposit. A list is attached to the check that indicates the amount paid by each individual customer. The amount of the check is the total amount paid by all customers listed.

Automated clearing house (ACH) payments are electronic payments. An automated clearing house (ACH) is an organization that operates as a clearing house for automated entries (electronic payments). An ACH processes entries between an originating depository financial institution and a receiving depository financial institution. Electronic payment remittance to vendors is always sent through an ACH. A prenotification must be successfully processed by the ACH for each vendor before actual electronic payments can be sent to the vendor.

Vendor Verify Status and Effective Date Range

A verify status and effective date range are associated with each vendor and customer account with vendor in the system and indicate whether the vendor or account with vendor can be used to perform remote banking transactions. The verify status code identifies the status of the vendor or account with vendor.

Valid verify status code values for vendors are awaiting ACH prenotification, failed verification, initial entry, pending ACH prenotification, and verified. Additional user-defined codes may exist; however, no payments can be made to a vendor with a user-defined status. Only vendors with a verified status can receive payments.

Valid verify status code values for a customer's account with vendor are initial, failed verification, or verified. Only accounts with a verified status can be used in processing.

When a payment is initiated for a vendor, the current date must fall within the effective date range before the vendor or customer account with vendor can be used in processing.

Accounts

BASE24 Remote Banking transactions can be performed on one or more specified customer accounts with a financial institution.

Identifying Accounts

All customer accounts are identified with an account number and an account type. The account number can consist of 1 to 19 numeric characters. An *account type* code identifies the type of customer application account. BASE24 provides a default account type code for each of the following types of accounts (the default account type is provided in parentheses): savings (SAV), checking (DDA), credit (CR), line of credit (LOC), certificate (CD), retirement (IRA), interest-bearing checking (NOW), commercial loan (CMRCL), installment loan (INSTL), and mortgage loan (MRTGL).

Besides the account number and type, a customer can use an account qualifier to identify accounts. An *account qualifier* is a user-defined code that can be used in place of the application account number and account type to identify and access an account. The account qualifier uniquely identifies an account to the customer. For example, if a customer has two savings accounts, account qualifiers of SAV and SAV1 could be used to differentiate the accounts. Account qualifiers serve as a convenient means of identifying accounts when performing transactions without having to provide the full account number.

A *from* account is the account debited in a transfer or payment transaction. On BASE24-telebanking CSR screens, the *from* account is always displayed in the ACCOUNT 1 field. A *to* account is the account credited in a transfer transaction. On BASE24-telebanking CSR screens, the *to* account is always displayed in the ACCOUNT 2 field.

Multiple Account Selection

If a transaction is initiated and two or more customer accounts with the same specified account number or account type exist, a screen listing all accounts of the specified type is presented. The specific accounts on which the transaction is to be performed can then be selected from this screen. This is known as *multiple account selection* and is available only if it is enabled on your system. For a discussion of how multiple account selection is enabled, refer to the “Multiple Account Selection” discussion provided in section 1.

Account Status

An *account status* code indicates the current status of the customer's application account. Only application accounts with a status that allows the requested transaction can be used in transaction processing. For example, one account may have an open status, which allows for any transaction, while another account may be "restricted to deposits," which means the account accepts all transactions except transfers, scheduled transfers, payments, and scheduled payments from this account. When an account is added, you can also specify whether the account can be credited, debited, or inquired upon during transaction processing.

Transactions

The BASE24 CSR screens enable you to perform a variety of transactions that fall under one of the following categories:

- Transfers
- Payments
- Inquiries
- Customer service
- Customer management
- Vendor management
- Security
- User-defined

In addition to the above, internal transactions are automatically performed by the system as a result of transactions entered at a CSR terminal.

You (the customer service representative), the customer's financial institution, and the calling customer must be allowed access to a transaction in the BASE24 database before it can be performed from a CSR terminal. Each of the above categories, and the transactions that fall within each category are defined in this subsection.

Transaction Categories

A *transfer* is defined as the movement of funds from one customer account to another customer account, with both accounts owned by the same financial institution. Transfers between accounts owned by the same financial institution are referred to as *internal transfers*. Transfers between accounts owned by different financial institutions are referred to as *external transfers* and must be performed as payments in BASE24 Remote Banking.

A *payment* is defined as the movement of funds from a customer account to a vendor (also known as a biller or payee). External transfers between two accounts owned by different financial institutions must be performed as payment transactions, where the financial institution owning the *to* account is configured as a customer vendor and the *to* account is configured as the customer's account with the vendor.

Both transfers and payments can be performed immediately or can be scheduled to be performed once on a specified future date or on a recurring basis (e.g., weekly or monthly) for a set number of periods. Transfers or payments that have not yet been made and are still scheduled to be performed are referred to as *scheduled transactions*. A *future transaction* is a payment or transfer transaction scheduled to be performed once on a future date. A *recurring transaction* is a payment or transfer transaction scheduled to be performed on a recurring basis for a set number of periods. Transactions exist that enable you to update or delete scheduled transactions.

Any payment or transfer that was originally scheduled and has now been successfully paid or completed is considered to be a *paid transaction*. For automated clearing house (ACH) payments, a configurable number of days must also elapse after the ACH payment has been approved and logged to the History Table (HIST) before the payment is considered to be paid. If the final disposition for a scheduled payment or transfer indicates that it failed after all retries are exhausted, it is not considered to be a paid transaction.

For payments and transfers, any transaction for which all actions (including any retry processing) have been completed is considered to be a *completed transaction*. For scheduled future and recurring payments and transfers, the payment or transfer is not considered to be complete until the actual withdrawal or transfer of funds has been made or after all retries have been exhausted.

Inquiry transactions enable you to display previously performed transactions (e.g., to determine whether a specific check has cleared) or to display currently configured information in the database (e.g., listing all the customer vendors for a customer). Inquiry transactions that display previously performed transactions can be referred to as *historical inquiry transactions*.

Customer service transactions enable you to perform an action on behalf of a customer.

Customer management transactions enable you to add, update, activate, and deactivate customer and customer account information currently stored in the BASE24 Remote Banking database.

Vendor management transactions enable you to add, update, activate, and deactivate vendor information currently stored in the BASE24 Remote Banking database.

Security transactions enable you to verify the identity of a calling customer, verify a customer's personal identification number (PIN), and change a customer's PIN.

User-defined transactions are transactions defined by ACI customers that fall outside the standard transaction set provided by ACI.

Internal transactions are transactions that are performed automatically by the system as a result of other entered transactions or operator actions.

Financial and Nonfinancial Transactions

All BASE24 Remote Banking transactions can be categorized as financial or nonfinancial transactions. Any transactions that credit or debit a customer account are considered to be *financial* transactions. Payments and transfers are financial transactions; however, transactions that schedule payments or transfers are nonfinancial transactions. Any transactions that do not credit or debit a customer account are considered to be *nonfinancial* transactions. Therefore, all inquiry, database maintenance, and security transactions, as well as transactions that schedule payments or transfers, are considered to be nonfinancial transactions.

Approved and Declined Transactions

All transactions can be approved or declined. An approved transaction is any transaction for which authorization is granted. A declined transaction is any transaction for which authorization is denied. With each approved or declined transaction, BASE24 provides a three-character code, called an *action code*, that indicates the reason why a transaction was approved or declined. For descriptions of all possible action codes, refer to the ***BASE24 Remote Banking Transaction Processing Manual***.

For approved financial transactions, an approval code can also be provided. An *approval code* is a random number generated by the authorizer for an approved financial transaction. An approval code is not generated for a financial transaction that is denied. An approval code is provided only if one is generated by the financial transaction authorizer. Some authorizers may not generate an approval code for an approved financial transaction.

Canceled Transactions

Any transaction that is approved and then subsequently canceled is referred to as a *canceled transaction*. For transactions entered from a CSR screen, a transaction must be canceled before any other transaction is performed and only approved transactions can be canceled. When a transaction is canceled, a reversal

transaction is generated to back out the originally approved transaction. You can cancel approved nonfinancial transactions only if allowed by the customer's financial institution. A time limit may also apply as to how long after a transaction is approved it can still be canceled.

Transfer Transactions

CSR screens support the following transactions related to transfers.

Transfer – immediate — A BASE24-telebanking transaction that immediately moves funds from one customer account to another customer account owned by the same financial institution.

Schedule transfer – future — A BASE24-billpay or Enhanced Telebanking transaction that schedules the movement of funds from one customer account to another customer account owned by the same financial institution to be performed on a specified future date.

Schedule transfer – recurring — A BASE24-billpay or Enhanced Telebanking transaction that schedules the movement of funds from one customer account to another customer account owned by the same financial institution to be performed on a recurring basis for a specified period.

Scheduled transfer delete — A BASE24-billpay or Enhanced Telebanking transaction that deletes a scheduled future transfer or all remaining scheduled recurring transfers.

Scheduled transfer update — A BASE24-billpay or Enhanced Telebanking transaction that enables customers to update a scheduled (future or recurring) transfer. This transaction can also be used to skip the next transfer. The following information can be updated in this transaction:

- Transfer amount
- Next transfer date
- Total number of recurring transfers
- Recurring period (e.g., weekly, every two weeks, monthly, quarterly, semi-annually, and annually)
- *From* account number

- *From* account type
- *To* account number
- *To* account type

Payment Transactions

CSR screens support the following transactions related to payments.

Schedule payment – immediate — A BASE24-billpay transaction that schedules the immediate payment of funds from a customer account to a customer vendor (also known as the payee or biller).

Schedule payment – future — A BASE24-billpay transaction that schedules the payment of funds from a customer account to a customer vendor (also known as the payee or biller) on a specified future date.

Schedule payment – recurring — A BASE24-billpay transaction that schedules the payment of funds from a customer account to a customer vendor (also known as the payee or biller) on a recurring basis (e.g., monthly or quarterly) for a specified period (e.g., 12 months).

Scheduled payment delete — A BASE24-billpay transaction that deletes a scheduled future payment or all remaining scheduled recurring payments.

Scheduled payment update — A BASE24-billpay transaction that enables customers to update a scheduled (future or recurring) payment. This transaction can also be used to skip the next payment. The following information can be updated in this transaction:

- Payment amount
- Next payment date
- Total number of recurring payments
- Recurring period (e.g., weekly, every two weeks, monthly, quarterly, semi-annually, and annually)
- Vendor specific data
- *From* account number
- *From* account type

Customer vendor request mailing — A BASE24-billpay transaction that requests a Customer Vendor List to be printed and mailed to a customer. The Customer Vendor List provides all the information the customer needs to identify customer vendors in payment transactions originated from a remote banking device. Refer to the *BASE24 Remote Banking End-of-Period Processing and Reporting Manual* for a description of the Customer Vendor List.

Inquiry Transactions

CSR screens support the following inquiry transactions.

Customer account list inquiry — A transaction that lists all the active application accounts configured for a customer ID to the system.

Account list inquiry with balances — A BASE24-telebanking transaction that displays the available balance or credit for all the active application accounts configured for a customer ID to the system.

Available funds inquiry — A BASE24-billpay transaction that provides balance and account information on a single account or on two accounts, simultaneously. Balance inquiry transactions are also referred to as available funds inquiry transactions. The number and type of balances returned for this transaction depends on the number and type of accounts on which the balances are requested.

Bank list inquiry — A BASE24-billpay or Enhanced Telebanking transaction that displays all financial institutions configured to the system. This transaction is performed automatically by the system any time you access the Bank List screen.

Bank branch list inquiry — A BASE24-billpay or Enhanced Telebanking transaction that displays all branches configured to the system for a financial institution. This transaction is performed automatically by the system any time you access the Bank Branch List screen.

Miscellaneous requests inquiry — A BASE24-billpay or Enhanced Telebanking transaction that displays previously entered miscellaneous requests. This transaction is performed automatically by the system any time you view a previously entered miscellaneous request from the Miscellaneous Request screen.

History inquiry – all transactions — A BASE24-billpay transaction that displays all previous transactions logged for a customer in the History Table (HIST).

History inquiry – payments and transfers — A BASE24-billpay or Enhanced Telebanking transaction that returns a list of payments and transfers that were originally scheduled and are now considered to be complete (i.e., final disposition has been reached). The most recently completed transactions are always returned first.

Check clearance inquiry — A BASE24-telebanking transaction that informs customers as to whether a particular check has cleared their account. Customers must provide the number of the check and can optionally provide the amount of the check.

Last count of account by source transactions inquiry — A BASE24-telebanking transaction that displays a list of transactions for a customer account that originated from a particular source, such as a remote banking device. The transactions are displayed in reverse chronological order.

Last count of account transfer transactions inquiry — A BASE24-telebanking transaction that displays a list of transfers to or from a specified customer account. The transactions are displayed in reverse chronological order.

Last count of check transactions inquiry — A BASE24-telebanking transaction that displays a list of all check transactions for a specified customer account. The transactions are displayed in reverse chronological order. Customers can optionally specify the number of a check to refine the search.

Last count of credit transactions inquiry — A BASE24-telebanking transaction that displays a list of transactions that credited a specified customer account. The transactions are displayed in reverse chronological order.

Last count of debit transactions inquiry — A BASE24-telebanking transaction that displays a list of transactions that debited a specified customer account. The transactions are displayed in reverse chronological order.

Last count of debit/credit transactions inquiry — A BASE24-telebanking transaction that displays a list of transactions that debited or credited a specified customer account. The transactions are displayed in reverse chronological order. Customers can optionally specify a range of dates for which transactions are to be reported.

Scheduled payments list inquiry — A BASE24-billpay transaction that displays the details of currently scheduled future and recurring payments for a customer.

Scheduled transfers list inquiry — A BASE24-billpay or Enhanced Telebanking transaction that displays the details of currently scheduled future and recurring transfers for a customer.

Scheduled transactions list inquiry — A BASE24-billpay or Enhanced Telebanking transaction that displays the details of all currently scheduled payments and transfers for a customer.

Statement closing download — A BASE24-telebanking transaction that displays a closing statement for a customer. Transactions are displayed in chronological order.

Statement download — A BASE24-telebanking transaction that displays statement information for a customer.

Customer Service Transactions

CSR screens support the following customer service transaction:

Check stop payment add — A BASE24-telebanking transaction that enables you to issue a check stop payment order on behalf of a customer.

Customer inquiry — A BASE24-billpay or Enhanced Telebanking transaction that retrieves customer information such as the customer's mailing address and phone numbers.

Loan application transaction — A BASE24-billpay or Enhanced Telebanking transaction that enables you to enter a loan application on behalf of a customer. The customer need not be configured to the system.

Miscellaneous request — A BASE24-billpay or Enhanced Telebanking transaction that enters customer questions, complaints or account maintenance requests that fall outside the scope of BASE24 Remote Banking service.

Customer Management Transactions

CSR screens support the following customer management transactions.

Customer account add — A BASE24-billpay or Enhanced Telebanking transaction that adds application accounts on behalf of a new customer.

Customer account update — A BASE24-billpay or Enhanced Telebanking transaction that updates customer account information. The information that can be updated includes the following:

- Account qualifier
- Debit allowed flag
- Credit allowed flag
- Inquiry allowed flag
- Account description

The customer's verify status must be set to verified before this transaction is allowed.

Customer account activate — A BASE24-billpay or Enhanced Telebanking transaction that activates a customer account. It changes the account's begin date to the current date and sets the account's end date to the value defined in the default customer account for the customer's financial institution.

Customer account deactivate — A BASE24-billpay or Enhanced Telebanking transaction that deactivates a customer account. This transaction changes the account's end date to the current date minus one day. Once a customer account is deactivated, it can no longer be used in transaction processing.

Note: BASE24 Remote Banking does not check to determine whether there are any outstanding transactions that use the customer account before the account is deactivated. Therefore, it may be beneficial to perform a scheduled transactions list inquiry transaction to determine whether there are any outstanding transactions for the account prior to using this transaction.

Customer account delete — A BASE24-billpay or Enhanced Telebanking transaction that deletes a customer account from the Customer/Account Relation Table (CACT).

Customer add — A BASE24-billpay or Enhanced Telebanking transaction that adds a new customer for remote banking services.

Customer update — A BASE24-billpay or Enhanced Telebanking transaction that changes customer information such as the customer's mailing address and phone numbers. The information that can be updated includes the following:

- Family name (last name)
- Given name (first name)
- Middle initial
- Title
- Street or mailing address
- City
- State
- Country
- Postal code
- Home phone
- Work phone
- Other phone 1 and description
- Other phone 2 and description
- Birth date
- Language
- Alternate contact
- Mother's maiden name
- Government ID
- Customer information (user-defined, 3 fields)
- Customer type
- Customer profile
- Branch

- Default account number and type
- Service fee account number and type

Customer activate — A BASE24-billpay or Enhanced Telebanking transaction that activates or reactivates a customer ID. This transaction changes a customer's verify status from initial to verified, sets the begin date for the customer ID to the current calendar date and the end date to the value defined in the default customer data for the customer's financial institution, and sets the timestamp for the customer's verify status to the current calendar date.

Customer deactivate — A transaction that sets the end date for the customer ID to the current calendar date minus one, thereby effectively removing the customer from service.

Customer inquiry — A BASE24-billpay or Enhanced Telebanking transaction that retrieves customer information such as the customer's mailing address and phone numbers.

Customer vendor add — A BASE24-billpay transaction that adds a customer vendor to the customer's vendor list.

Customer vendor update — A BASE24-billpay transaction that updates customer vendor information or vendor information. This transaction enables you to update the following customer vendor information for all customer vendors, regardless of the customer's verify status:

- Account with vendor
- Budget category
- Customer vendor short name
- User information (2 fields)

This transaction also enables you to update the actual vendor fields in the vendor registry. The following fields in these tables can be updated by any customer for most vendors. The only exceptions are public vendors with a vendor verify status of verified. Customers can not update any of these fields because these vendors are used by many customers. Therefore, the vendor and vendor branch information for these vendors is in effect *owned* by the system owner, not an individual customer.

- Vendor name

- Vendor branch name
- Address fields 1 and 2
- City
- State
- Postal code
- Phone
- Account with vendor
- Customer vendor short name
- Budget category
- Customer vendor user information (2 fields)
- Vendor branch information (2 fields)
- Vendor branch remittance information (2 fields)
- Vendor information (2 fields)
- Vendor remittance information (2 fields)

Customer vendor activate — A BASE24-billpay transaction that activates a customer vendor. This transaction can be performed if the customer vendor has a verify status of either verified or initial. If the verify status is initial, BASE24 changes the status to verified and updates the verify status timestamp to the current date and time. BASE24 also sets the begin date for the customer vendor to the current calendar date and sets the end date to the maximum date allowed. If the verify status is verified, BASE24 changes the begin and end dates only.

Customer vendor deactivate — A BASE24-billpay transaction that sets the end date for a customer vendor to the current calendar date minus one, thereby effectively preventing the customer from sending payments to the vendor.

Customer verify — A BASE24-telebanking transaction that identifies the customer to the system for verification purposes. This is an internal transaction that is automatically performed by the system when you attempt to verify a customer on the Customer Verify Request screen. A customer ID, customer name, or customer account number is required for this transaction. This transaction is not routed or logged to the ITS Transaction Log File (ITLF).

Customer select — A BASE24-telebanking transaction that selects a particular customer from a list of customers. This transaction is performed when the Multiple Customer Selection screen is displayed in response to a customer verify request. This transaction enables you to select a particular person or customer ID in the following cases:

- When more than one person is configured for the customer ID provided in a customer verify request (e.g., when a customer ID is assigned to a business and several different employees are allowed to use the ID).
- When the full or partial customer name is provided in the customer verification request.

The transaction is not routed or logged to the ITS Transaction Log File (ITLF).

Vendor Management Transactions

CSR screens support the following transactions related to vendor management.

Customer vendor list inquiry — A BASE24-billpay transaction that returns a list of all the customer vendors currently defined for a customer.

Master vendor list inquiry — A BASE24-billpay transaction that displays the master list of vendors registered to the system.

Customer vendor mask verify inquiry — A BASE24-billpay transaction that returns a list of all vendor masks associated with a vendor and vendor branch. This transaction also verifies the customer account with vendor against each mask if the customer account with vendor is specified.

Customer vendor list inquiry — A BASE24-billpay transaction that returns a list of all the customer vendors currently defined for a customer.

Master vendor list inquiry — A BASE24-billpay transaction that displays the master list of vendors registered to the system.

Customer vendor mask verify inquiry — A BASE24-billpay transaction that returns a list of all vendor masks associated with a vendor and vendor branch. This transaction also verifies the customer account with vendor against each mask if the customer account with vendor is specified.

Security Transactions

CSR screens support the following transactions related to security.

PIN verify — A BASE24-telebanking transaction that verifies the PIN a customer enters against the PIN stored for them in the system. If the PINs do not match, the system either requests the customer to reenter the PIN, locks the customer out of the system, or refers the customer call for security processing. PIN verification provides a means of determining the authenticity of the customer. Financial institutions have the option to determine whether an approved PIN verify transaction is required, not required, or preferred, before transaction processing access is allowed for a customer at a CSR terminal.

PIN change — A BASE24-telebanking transaction that enables customers to select a different PIN from the one they are currently using. PINs can be changed when desired by the customer or when enforced by the customer's financial institution or service provider. Customers may also be required to perform a PIN change transaction to select their initial PIN the first time they access the system.

User-defined Transactions

All user-defined transactions are entered from Authorization screen 1 in the transfer or user-defined format.

Your supervisor should be able to provide you with the information you need to perform any user-defined transactions supported by your organization.

Internal Transactions

Some transactions are performed automatically by the system as a result of other entered transactions or other functions performed. These internal transactions are described below.

Transfer – future — An internal BASE24-billpay or Enhanced Telebanking transaction that authorizes the debit of the customer's *from* account for a future transfer that was previously scheduled. This transaction is automatically performed by the system, but you can still display it in a historical inquiry transaction.

Transfer – recurring — A BASE24-billpay or Enhanced Telebanking transaction that authorizes the debit of the customer's *from* account for a recurring transfer that was previously scheduled. This transaction is automatically performed by the system, but you can still display it in a historical inquiry transaction.

Payment – immediate — An internal BASE24-billpay transaction that authorizes the debit of the customer's *from* account for a scheduled payment – immediate transaction. This transaction is automatically performed by the system and is not logged to the History Table (HIST).

Cancel immediate payment — An internal BASE24-billpay transaction that cancels an approved immediate scheduled payment. This transaction is performed automatically by the system when you press the **F6** key on New Payment screen 1 in the immediate response format to cancel an approved immediate payment.

Payment – future — An internal BASE24-billpay transaction that authorizes the debit of the customer's *from* account for a future payment that was previously scheduled. This transaction is automatically performed by the system, but you can still display it in a historical inquiry transaction.

Payment – recurring — An internal BASE24-billpay transaction that authorizes the debit of the customer's *from* account for a recurring payment that was previously scheduled. This transaction is automatically performed by the system, but you can still display it in a historical inquiry transaction.

Master vendor add — An internal BASE24-billpay transaction that adds a master vendor to the vendor registry. This transaction is performed automatically by the system when you add a customer vendor from the Customer Vendor Detail screen and that vendor is not already registered to the system. This transaction is performed only if the financial institution or service provider uses an open vendor list.

Billing

Several terms are used on CSR screens to define how customers are billed for remote banking service when the BASE24-billpay add-on Billing Application is used. For more information on these terms, refer to the ***BASE24-billpay Billing Application Manual***.

The *billing type* identifies the service level and fee structure for the remote banking service. Your supervisor should provide you with a list of all possible billing types and the service level and fees associated with each type.

The *billing group* identifies the billing statement cycle for the customer. Your supervisor should provide you with a list of all possible groups and the associated statement cycles. The billing statement cycle establishes the length of the period (e.g., monthly or quarterly) and the dates (e.g., the first or tenth of each month) for which transaction activity is billed to the customer.

Billing fees can be automatically deducted from a customer's account, which is referred to as a *service fee account* on CSR screens.

Section 3

CSR Procedures

This section describes step-by-step procedures you can use to aid you in the daily handling of customer requests. Refer to the individual screen descriptions provided in sections 4 through 38 of this manual if you need more detailed information on a particular screen or fields as you perform these procedures.

The following procedures are provided:

- Verifying customers
 - Identifying and verifying the customer
 - Verifying the customer's PIN
 - Changing the customer's PIN
- Entering a loan application
- Entering miscellaneous requests
- Displaying miscellaneous requests
- Signing up a new customer
- Managing customer information
 - Displaying customer information
 - Updating customer information
 - Activating or deactivating a customer ID
- Displaying account balances
 - Displaying the balance of a single account
 - Displaying the balance of two accounts simultaneously
 - Displaying the balance of all (multiple) customer accounts
- Managing customer accounts
 - Listing all configured customer accounts

- ❑ Modifying a customer account
 - ❑ Activating or deactivating a customer account
- Entering and managing payments
 - ❑ Entering an immediate scheduled payment
 - ❑ Entering a future scheduled payment
 - ❑ Entering a recurring scheduled payment
 - ❑ Changing a scheduled payment
 - ❑ Skipping the next payment period for a recurring scheduled payment
 - ❑ Deleting a scheduled payment
- Entering and managing transfers
 - ❑ Entering an immediate transfer
 - ❑ Entering a future scheduled transfer
 - ❑ Entering a recurring scheduled transfer
 - ❑ Changing a scheduled transfer
 - ❑ Skipping the next transfer period for a recurring scheduled transfer
 - ❑ Deleting a scheduled transfer
- Displaying currently scheduled transactions
 - ❑ Displaying scheduled payments only
 - ❑ Displaying scheduled transfers only
 - ❑ Displaying both scheduled payments and transfers
- Entering a user-defined transaction
- Managing vendors
 - ❑ Listing all customer vendors available to a customer
 - ❑ Printing a Customer Vendor List for a customer
 - ❑ Adding a customer vendor
 - ❑ Updating customer vendor information
 - ❑ Activating or deactivating a customer vendor
- Displaying previous transactions
 - ❑ Determining whether a particular check has cleared
 - ❑ Displaying debit transactions

- ❑ Displaying credit transactions
- ❑ Displaying debit and credit transactions for a specified time period
- ❑ Displaying check transactions
- ❑ Displaying transactions entered from a particular source (e.g., a remote banking device)
- ❑ Displaying unscheduled transfer transactions
- ❑ Displaying completed payments and transfers
- ❑ Displaying BASE24-billpay transaction history
- ❑ Displaying statement closing information
- ❑ Displaying statement information
- Stopping payment on a check

Customer Verification

This subsection provides step-by-step procedures for verifying a customer. It includes procedures for identifying and verifying the customer, verifying the customer PIN, and changing the customer PIN.

Every customer call must be verified before any transactions can be performed on behalf of the customer, except when signing up a new BASE24-billpay customer or when entering a loan application. The customer's PIN must be verified if required by the customer's financial institution.

Identifying and Verifying the Customer

To identify and verify a customer, perform the following steps. This procedure assumes that you are currently logged on to the system and are accessing a CSR screen.

1. Press the **F2** key to display the Customer Verify Request screen if it is not currently displayed.
 - a. If you are talking to a new customer who wants to sign up for remote banking service, perform one of the following, depending on whether the customer's financial institution uses preloaded data:
 - 1) If the customer's financial institution uses preloaded data, continue with step 1c.
 - 2) If the customer's financial institution does not use preloaded data, you can either enter the customer's name and attempt to verify it to determine whether the customer was previously entered (see step 1c below) or you can leave all customer fields blank and press the **F8** key to display the Bank List screen and follow the procedure for signing up a new customer provided elsewhere in this section.
 - b. If you are talking to a customer who wants to apply for a loan, enter the customer name and press the **F7** key to display the Loan Application screen. Follow the procedure for filling out a loan application.
 - c. If you are talking to a customer who is already configured to the system and wants to perform transactions, enter the customer's ID, a valid customer account number, or the customer's name and press the **F2** key to verify the customer.

If your system uses a name token generation algorithm (e.g., Soundex), you should always attempt to enter the full customer name as accurately as possible to effectively narrow the search.

If your system does not use a name token generation algorithm, you should only enter the characters of the customer name that you know are correct. If you misspell the name, the system may not be able to find the configured customer information and an error message may be displayed.

Note: If your system uses the BASE24-telebanking product only, the customer's data must already be configured to the system by back-office personnel using file and table maintenance screens, before access to CSR screens is allowed.

- 1) If the system cannot immediately identify the customer from the information provided, either the verification request will be denied or the Multiple Customer Selection screen will be displayed.
 - a) If the verification request is denied, try reentering the information or changing the information and press the **F2** key again. Some information may have been entered incorrectly or misspelled the first time.
 - b) The Multiple Customer Selection screen can be displayed for either of the following reasons: more than one customer is configured for the entered customer ID, or you enter a customer name that exactly matches or is similar in spelling to the name of one or more customers configured to the system.
 - 2) If the Multiple Customer Selection screen is displayed, position the cursor next to the appropriate customer selection and press the **F1** key. You may need to ask the customer to provide his or her address or home phone number to determine the correct selection. If you still cannot identify the customer on this screen, you can press the **F2** key to redisplay the Customer Verify Request screen and try again.
2. Upon successful identification of a configured customer, the Customer Verify Response screen is displayed. This screen displays PIN information, the type of customer (i.e., business or individual), and customer verification information that can be used to authenticate the identity of the customer. On this screen, perform the following steps as required or dictated by your organization:
- a. Check the value of the PIN OPTION field to determine whether a PIN verify transaction must be performed. If so, no other transactions can be performed until the PIN is verified and approved. If PIN verification is required, either follow the procedure for verifying the customer's PIN, or complete step c below first. If PIN verification is preferred, but not required, this means that the customer's financial institution normally requires PIN verification, but you can still perform a customer transaction without a PIN if you are confident of the customer's identity through other means (see step c below).

- b. Check the value of the PIN CHANGE REQUIRED field. If this field displays an S or Y value, the PIN change transaction is the only transaction allowed. If so, either follow the procedure for changing the customer's PIN or complete step c below first.
 - c. Verify the identity of the customer by having him or her provide personal details as required by your organization. You can have the customer provide some or all of the information displayed in the CUSTOMER VERIFICATION INFORMATION fields. Alternatively, you can press the **F5** key to display the Customer Personal Detail screen. You can then have the customer provide selected information displayed on this screen such as the customer's government ID (e.g., social security number), birth date, or mother's maiden name. The exact information required and the actions to take if the customer cannot be authenticated will be determined by the policies of your organization.
 - 1) If a PIN verify transaction was required on the Customer Verify Response screen but has not been performed, follow the procedure for verifying the customer's PIN.
 - 2) If a PIN change transaction was required on the Customer Verify Response screen but has not yet been performed, follow the procedure for changing the customer's PIN.
3. After successfully verifying the customer, perform one of the following:
 - Press the **F8** key to display the Customer Signup screen if the customer is calling to sign up for remote banking service and you need to activate service.
 - Press the **F4** key to display the Transaction Menu to select a transaction requested by the customer. Follow the appropriate procedure in this section for the transaction selected.

Verifying the Customer's PIN

The customer's PIN must be verified when the value of the PIN OPTION field on the Customer Verify Response screen indicates that PIN verification is required. PIN verification can also be performed, if this field indicates that PIN verification is preferred, but not required. If PIN verification is required, no other transactions can be performed on behalf of the customer until the PIN verify transaction is successfully approved.

You can also verify a customer's PIN at any time during a session with a customer by selecting the PIN VERIFY transaction on the Transaction Menu.

Assumption: The customer is allowed to perform PIN verify transactions.

To verify a customer's PIN, perform the following:

1. If either the Customer Verify Response or Customer Personal Detail screen is currently displayed, press the **F3** key. If any other CSR screen is currently displayed, press the **F4** key to display the Transaction Menu and select the PIN VERIFY transaction. In either case, Authorization Request screen 1 (PIN verify) is displayed.
2. Obtain the PIN from the customer and enter it in the PIN field on Authorization Request screen 1 (PIN verify). For security reasons, the digits you enter in this field are not displayed on the screen.
3. Press the **F5** key to authorize the transaction. Authorization Response screen 1 (PIN transactions) is displayed.
4. Check the response information on Authorization Response screen 1 (PIN transactions) to determine whether the entered PIN was approved. A value of 000 in the Action Code field indicates approval. If the entered PIN was declined, a different value will be displayed in the Action Code field.

If the PIN was approved, press the **F4** key to display the Transaction Menu. You can then select a transaction to be performed.

If the PIN was declined, determine the reason for the denial and take the appropriate actions. Actions may include attempting to verify the PIN again, terminating the call, or referring the call for security processing. The exact actions to take may vary according to the policies of your organization.

Changing the Customer's PIN

The customer's PIN must be changed when the PIN CHANGE REQUIRED field on the Customer Verify Response screen displays a value of Y or S. A PIN change may be required when enforced by the customer's financial institution or when a customer accesses the system for the first time to select his or her initial PIN. If a PIN change is required, no other transactions can be performed on behalf of the customer until the PIN change transaction is successfully approved.

You can also change a customer's PIN at any time during a session with a customer by selecting the PIN CHANGE transaction on the Transaction Menu.

Assumption: The customer is allowed to perform the PIN change transaction.

To change a customer's PIN, perform the following:

1. If either the Customer Verify Response or Personal Customer Detail screen is currently displayed, press the **F6** key. If any other CSR screen is currently displayed, press the **F4** key to display the Transaction Menu and select the PIN CHANGE transaction. In either case, Authorization Request screen 1 (PIN change) is displayed.
2. If the customer needs to change an existing PIN, obtain the existing PIN from the customer and enter it in the PIN field on Authorization Request screen 1 (PIN change). For security reasons, the digits you enter in this field are not displayed on the screen. If the customer is selecting his or her initial PIN, you can leave this field blank.
3. Obtain the new or initial PIN from the customer and enter it in the NEW PIN field. Again, for security reasons, the digits you enter in this field are not displayed on the screen.
4. Press the **F5** key to authorize the transaction. Authorization Response screen 1 (PIN transactions) is displayed.
5. Check the response information on Authorization Response screen 1 (PIN transactions) to determine whether the PIN change was approved. A value of 000 in the Action Code field indicates approval. If the PIN change was declined, a different value will be displayed in the Action Code field.

If the PIN change was approved, press the **F4** key to display the Transaction Menu. You can then select a transaction to be performed.

If the PIN change was declined, determine the reason for the denial and take the appropriate actions. Actions may include attempting to change the PIN again, terminating the call, or referring the call for security processing. The exact actions to take may vary according to the policies of your organization.

If you attempt to change the PIN again, repeat steps 1 through 5. Otherwise, press the **F2** key to display the Customer Verify Request screen in preparation for the next customer call.

Entering a Loan Application

The following procedure enables you to enter a loan application on behalf of the customer. A loan application can be entered for customers who are already configured to the system and those who are not.

Assumption: You are allowed to perform loan application transactions on behalf of the customer.

To enter a customer loan application, perform the following:

1. Access the Loan Application screen. You can access this screen either by entering the customer name and pressing the **F7** key on the Customer Verify Request or by selecting the LOAN APPLICATION transaction on the Transaction Menu after verifying the customer.
2. On Loan Application screen 1, enter the customer's name in the Applicant Information: Name fields and the amount of the loan requested in the Amount Requested field. These are the only required fields on the Loan Application screens. If the customer's name was already entered on a previous screen, the Name fields will already be filled in.
3. Enter information in the remaining fields on screens 1 through 6 as required by the policy of the customer's financial institution or the service provider. Your supervisor should instruct you on the exact information required. Use the **F9** and **F11** keys to move among the Loan Application screens as you fill in this information.
4. After you have entered all information required for the loan application, press the **F5** key to submit it. The information entered is stored in the Loan Application Table and is reported on the Loan Application Report for review by qualified personnel. This report is generated automatically by the system on a daily basis. Refer to the ***BASE24 Remote Banking End-of-Period Processing and Reporting Manual*** for a detailed description of the Loan Application Report.
5. If the customer is configured to the system and wants to perform a different transaction, press the **F4** key to display the Transaction Menu.
6. If you have completed all transactions requested by this customer, press the **F2** key to display the Customer Verify Request screen in preparation for the next customer call.

Entering Miscellaneous Information

The following procedure enables you to enter miscellaneous information such as customer questions, complaints, or account maintenance requests that fall outside the scope of BASE24-billpay service.

Assumptions: The customer has been verified for the current call.
 You are allowed to perform miscellaneous request transactions on behalf of the customer.

To enter miscellaneous information, perform the following:

1. Access the Miscellaneous Request screen either by selecting the MISCELLANEOUS REQUEST transaction on the Transaction Menu or by pressing the **F14** key on the Customer Information screen.
2. Enter the appropriate information in the following required fields: Contact Type, Priority, and Contact Details.
3. Optionally enter data in the following optional fields: Phone, Type, and Department. The policies of your organization should determine which, if any, of these fields are used.
4. Press the **F5** key to submit the miscellaneous request. A message indicating the success or failure of the request is displayed at the bottom of the screen.
5. If the request is successfully submitted, the information in the request is written to the Miscellaneous Request Table and is reported in the Miscellaneous Request Report. This report is generated automatically by the system on a daily basis, with requests grouped by financial institution identifier (FIID). This report can then be reviewed by qualified service provider or financial institution back-office personnel. Refer to the ***BASE24 Remote Banking End-of-Period Processing and Reporting Manual*** for a detailed description of the Miscellaneous Request Report.
6. If the customer wants to perform a different transaction, press the **F4** key to display the Transaction Menu.
7. If you have completed all transactions requested by this customer, press the **F2** key to display the Customer Verify Request screen in preparation for the next customer call.

Displaying Miscellaneous Requests

The following procedure enables you to display miscellaneous requests previously submitted on behalf of a BASE24-billpay customer.

Assumptions: The customer has been verified for the current call.
 You are allowed to perform a miscellaneous requests inquiry transaction on behalf of the customer.

To display previously submitted miscellaneous requests, perform the following:

1. Access the Miscellaneous Request screen either by selecting the MISCELLANEOUS REQUEST INQUIRY transaction on the Transaction Menu or by pressing the **F14** key on the Customer Information screen.
2. Display previously entered requests entered on behalf of the current customer by pressing the **Shift-F6** and **Shift-F7** keys. The **Shift-F6** keys display the most recent request submitted on behalf of the customer. The **Shift-F7** keys display the previous request submitted before the currently displayed request. Thus, the **Shift-F7** keys allow you to move one request backwards in time each time these keys are pressed. Using the **Shift-F6** and **Shift-F7** keys you can peruse requests according to the order in which they were entered chronologically, moving one request backward in time, respectively, starting with the most recent request. You can press the **Shift-F6** keys at any time to redisplay the most recent request.
3. When you find the request you are looking for, convey the request information to the caller as required.
4. If the customer wants to perform a different transaction, press the **F4** key to display the Transaction Menu.
5. If you have completed all transactions requested by this customer, press the **F2** key to display the Customer Verify Request screen in preparation for the next customer call.

Signing Up a New BASE24-billpay Customer

The following procedures allow you to sign up new customers for BASE24-billpay service.

Assumption: You are allowed to perform customer add and customer activate transactions on behalf of the customer.

Note: This procedure is required if the customer's financial institution did not preload the customer's data to the system.

To sign up a new customer for BASE24-billpay service, perform the following:

1. While either the Customer Verify Request or Customer Verify Response screen is currently displayed, press the **F8** key.
2. Select a financial institution for the customer if required.
 - If the BANK field at the top of the CSR screen in step 1 was blank, Bank List screen 1 is displayed. You must select the customer's financial institution from this screen using the **F1** key before access to the Customer Signup screen is granted. If the financial institution you choose uses preloaded customer data, the system automatically takes you back to the Customer Verify screen instead of the Customer Signup screen. You are not allowed to access the Customer Signup screen for a customer with preloaded data without first verifying the customer.
 - If the BANK field at the top of the CSR screen in step 1 was not blank (i.e., the customer's data was preloaded and has already been verified), the Customer Signup screen is displayed.
3. When Customer Signup screen 1 is displayed, verify and update the customer information or add it, depending on whether the customer's ID was provided when you accessed the screen.
 - a. If the customer's ID was provided before you accessed the Customer Signup screen (i.e., the customer's data was preloaded), data will be displayed in all required fields as well as any optional fields in which data was preloaded. Verify this information with the customer for accuracy and update any information that is incorrect or has changed (e.g., the customer's address) using the **F8** key.
 - b. If the customer's ID was not provided before you accessed this screen (i.e., the customer's data was not preloaded), enter the appropriate data in all required fields and desired optional fields. Default data defined by the customer's financial institution may be displayed in many of the fields. Fill in all applicable fields on screens 1 and 2.

- 1) If you need to change the customer's financial institution (BANK) after accessing the Customer Signup screen, press the **Shift-F6** keys to access the Bank List screen. Select the desired financial institution on this screen and return it to the Customer Signup screen by positioning the cursor on the financial institution entry and pressing the **F1** key. You cannot change the customer's financial institution once the customer's information has been updated or added using the **F8** or **F14** keys.
- 2) If you need to change the customer's main financial institution branch designation after accessing the Customer Signup screen, press the **Shift-F5** keys to access the Branch List screen. Select the desired branch on this screen and return it to the Customer Signup screen by positioning the cursor on the branch entry and pressing the **F1** key.
- 3) After entering data in all required fields and desired optional fields on screens 1 and 2, press the **F14** key to add the new customer information to the database. Depending on how the customer's financial institution is configured, you may have to enter a customer ID or the system will automatically assign a customer ID when the customer data is added. A message will be displayed if you are required to enter a customer ID when you press the **F14** key.

You must press the **F8** or **F14** keys before you exit the Customer Signup screen, or the customer information will be lost.

Note: For financial institutions not using preloaded customer data, it is possible to add the same customer more than once. Therefore, appropriate procedures should be in place to avoid unnecessary duplication.

4. Verify and update the customer's accounts or add them, depending on whether the customer's data was preloaded. Press the **F13** key to display the Customer Account List screen.
 - If the customer's accounts were preloaded, verify the configured customer account information on this screen as required by your organization. In some cases, the account information may have already been verified by back-office personnel. If you need to verify the accounts and any account information is incorrect or has changed, you can update it by positioning the cursor on the account information and pressing the **F8** key. You can also delete accounts using the **F13** key, and activate or deactivate accounts using the **F15** and **F6** keys, respectively. If you need to add additional accounts, enter the account information in the New fields and press the **F5** key. When you are finished, press the **F16** key to return to the Customer Signup screen.

- If the customer's accounts were not preloaded, enter each of the customer's accounts in the New fields and press the **F5** key to add the account. When you are finished, press the **F16** key to return to the Customer Signup screen.

For all accounts added on the Customer Account List screen, the New: Account Number, Type, and Allowed fields are required, while the New: Description and Qualifier fields are optional. Default data configured on behalf of the customer's financial institution is used to fill in data for the following fields for the account: Status, Begin, and End.

Depending upon the policies of your organization, any accounts you enter on this screen may need to be verified by back-office personnel before they can be used in processing. In which case, the back-office personnel will activate the accounts after they have been successfully verified. Inform the customer that they cannot use their accounts until after they have been verified and activated.

5. Activate the customer's ID or verify, update, and activate the customer's ID, depending on whether or not the customer's data was preloaded. The steps involved to verify the customer information are dictated by the policies of your organization.
 - To initiate remote banking service for a customer whose data has been preloaded and verified, press the **F15** key to activate the customer's ID. If you need to change any of the customer's information before exiting the Customer Signup screen, you may do so using the **F8** key, even after the customer's ID is activated.
 - For a customer whose data was not preloaded, the data should be verified for accuracy according to the policies of the customer's financial institution or the service provider before the customer's ID is activated. Some of the customer information may also be changed after it is added. If you need to change any of this information after the customer information is added, you may do so using the **F8** key. Once the data has been added and verified, activate remote banking service for the customer's ID by pressing the **F15** key. If the customer information must be verified before the customer's ID can be activated, let the customer know when he or she can expect to begin service.

Activation of a customer ID automatically changes the Customer Verify Status field to the value VERIFIED, sets the End Date field to a nonexpiring value, and creates a row for the customer in the Customer Billpay Table (CBPT). Data from this row is then displayed on Customer Signup screen 3. For more information on the CBPT, refer to the ***BASE24-billpay Tables Maintenance Manual***. Once a customer's ID has been activated, the customer is allowed to perform transactions specified in his or her profile.

6. Exit the Customer Signup screen by pressing the **F2** key to begin processing the next customer or by pressing the **F4** key to begin transaction processing for a newly activated customer ID.

Managing BASE24-billpay Customer Information

This subsection contains the following procedures:

- Displaying customer information
- Updating customer information
- Activating or deactivating a customer ID

Displaying Customer Information

The following procedure enables you to display the current information configured for the customer and his or her customer ID.

Assumptions: The customer has been verified for the current call.
 You are allowed to perform a customer inquiry transaction on behalf of the customer.

To display customer ID information, perform the following:

1. From any CSR screen, press the **F4** key to display the Transaction Menu. Select any customer transaction (e.g., CUSTOMER INQUIRY). The Customer Information screen is displayed.
2. The current configuration for the customer's ID and personal information is displayed. There are three screens of customer information. Data is displayed on screen 3 only after the customer ID has been activated. Use the **F9** and **F11** keys to move between these screens and convey the requested information to the customer.
3. At this point, you can perform any one of the following functions:
 - Update customer information. Follow the procedure for "Updating Customer Information" provided later in this subsection.
 - Activate or deactivate the customer's ID. Follow the procedure for "Activating or Deactivating a Customer ID" provided later in this subsection.
 - Request a Customer Vendor List to be printed and mailed to the customer. Press the **Shift-F9** keys to generate the list.
 - Enter a new scheduled payment for the customer. Press the **Shift-F1** keys and follow the appropriate procedure provided under the "Payment Transactions" heading in this section.
 - Enter a new scheduled transfer for the customer. Press the **Shift-F2** keys and follow the appropriate procedure provided under the "Transfer Transactions" heading in this section.
 - Display a previously scheduled transaction. Press the **Shift-F4** keys and follow the procedure for "Displaying a Scheduled Transaction" provided elsewhere in this section.

- If you need to change the customer's main financial institution branch designation, press the **Shift-F5** keys to access the Branch List screen. Select the desired branch on this screen and return it to the Customer Information screen by positioning the cursor on the branch entry and pressing the **F1** key.
 - Display previous BASE24-billpay transaction history. Press the **Shift-F6** keys and follow the procedure for "Displaying BASE24-billpay Transaction History" provided elsewhere in this section.
 - Enter or display a miscellaneous request. Press the **F14** key and follow the procedures for "Entering Miscellaneous Information" or "Displaying Miscellaneous Requests" provided elsewhere in this section.
4. If the customer wants to perform a different transaction, press the **F4** key to display the Transaction Menu.
 5. If you have completed all transactions requested by this customer, press the **F2** key to display the Customer Verify Request screen in preparation for the next customer call.

Updating Customer Information

The following procedure enables you to update the current information configured for the customer and his or her customer ID.

Assumptions: The customer has been verified for the current call.
You are allowed to perform a customer update transaction on behalf of the customer.

To update customer ID information, perform the following:

1. From any CSR screen, press the **F4** key to display the Transaction Menu. Select any customer transaction (e.g., CUSTOMER UPDATE). The Customer Information screen is displayed.
2. The current configuration for the customer's ID and personal information is displayed. Change the requested information on screens 1 and 2. Data is displayed on screen 3 only after the customer ID has been activated. Use the **F9** and **F11** keys to move between these screens as needed. After you have changed all requested data, press the **F8** key to update it. A message indicating the success or failure of the request is displayed at the bottom of the screen.
3. At this point, you can perform any one of the following functions:
 - Activate or deactivate the customer's ID. Follow the procedure for "Activating or Deactivating a Customer ID" provided later in this subsection.
 - Request a Customer Vendor List to be printed and mailed to the customer. Press the **Shift-F9** keys to generate the list.
 - Enter a new scheduled payment for the customer. Press the **Shift-F1** keys and follow the appropriate procedure provided under the "Payment Transactions" heading in this section.
 - Enter a new scheduled transfer for the customer. Press the **Shift-F2** keys and follow the appropriate procedure provided under the "Transfer Transactions" heading in this section.
 - Display a previously scheduled transaction. Press the **Shift-F4** keys and follow the procedure for "Displaying a Scheduled Transaction" provided elsewhere in this section.

- If you need to change the customer's main financial institution branch designation, press the **Shift-F5** keys to access the Branch List screen. Select the desired branch on this screen and return it to the Customer Information screen by positioning the cursor on the branch entry and pressing the **F1** key.
 - Display previous BASE24-billpay transaction history. Press the **Shift-F6** keys and follow the procedure for "Displaying BASE24-billpay Transaction History" provided elsewhere in this section.
 - Enter or display a miscellaneous request. Press the **F14** key and follow the procedures for "Entering Miscellaneous Information" or "Displaying Miscellaneous Requests" provided elsewhere in this section.
4. If the customer wants to perform a different transaction, press the **F4** key to display the Transaction Menu.
 5. If you have completed all transactions requested by this customer, press the **F2** key to display the Customer Verify Request screen in preparation for the next customer call.

Activating or Deactivating a Customer ID

The following procedure enables you to activate or deactivate a customer ID. A customer ID must be activated before it can be used for financial transactions. Deactivation is required when a customer no longer wants remote banking service, or when a customer's service is to be terminated for any reason. You can also reactivate a customer ID after it has been deactivated, if reactivation is allowed by the customer's financial institution.

Assumptions: The customer has been verified for the current call.
 You are allowed to perform customer activate and customer deactivate transactions on behalf of the customer.

To activate, reactivate, or deactivate a customer ID, perform the following:

1. From any CSR screen, press the **F4** key to display the Transaction Menu. Select any customer transaction (e.g., CUSTOMER ACTIVATE). The Customer Information screen is displayed.
2. Press the **F15** key to activate or reactivate the customer's ID, or press the **F6** key to deactivate the customer's ID. For deactivation, perform the following. Otherwise, continue with the next step.
 - a. If the customer has no currently scheduled transactions, press the **F6** key again to confirm the deactivation.
 - b. If the customer has any currently scheduled transactions, a message is displayed to indicate this. In this case, perform the following:
 - 1) Press the **Shift-F4** keys to display the Scheduled Transactions screen.
 - 2) Position the cursor next to each scheduled transaction entry and press the **F6** key to delete it. Use the QUERY fields, the **Shift-F7** and **Shift-F8** keys, and the cursor position keys to position the cursor next to all subsequent scheduled transactions.
 - 3) After all of the customer's scheduled transactions are deleted, press the **F16** key to return to the Customer Information screen and repeat step 2.
3. Check the screen message and the Customer Verify Status, Start Date, and End Date fields on screen 1 to ensure that the activate or deactivate function completed successfully.
4. If the customer wants to perform a different transaction, press the **F4** key to display the Transaction Menu.

5. If you have completed all transactions requested by this customer, press the **F2** key to display the Customer Verify Request screen in preparation for the next customer call.

Displaying Account Balances

The following procedures allow you to display the current balance of one or two accounts.

Displaying the Available Balance of One Account

The following procedure enables you to display the current available balance of one customer account.

Assumptions:

- The customer has been verified for the current call.
- The customer account has been configured to the system.
- The customer is allowed to perform available funds inquiry transactions.

To enter an available funds inquiry transaction on one account, perform the following:

1. From any CSR screen, press the **F4** key to display the Transaction Menu.
2. Select the AVAILABLE FUNDS INQUIRY transaction. The Transaction Selection screen is displayed.
3. On the Transaction Selection screen, select the account type on which the available funds inquiry transaction is to be performed (e.g., AVAIL FUNDS INQUIRY DDA). Authorization Request screen 1 (one-sided, set 1) is displayed.
4. Optionally enter the account number or account qualifier of the account in the ACCOUNT 1 NUMBER and ACCOUNT 1 QUALIFIER fields, if this is known. Otherwise, the system will determine the account from the account type specified when you authorize the transaction.
5. Press the **F5** key to authorize the transaction. If the customer has two or more accounts of the account number or account type specified and multiple account selection is not enabled, the system automatically selects which account to use based on an account selection hierarchy. If multiple account selection is enabled, the Account Selection screen is displayed. Select the specific account on which the balance inquiry is to be performed. The account number and qualifier are returned and displayed in the ACCOUNT 1 NUMBER and ACCOUNT 1 QUALIFIER fields on Authorization Request screen 1 (one-sided, set 1).

6. Authorization Response screen 1 is displayed. This screen overlays the bottom half of the original Authorization Request screen. Check the value of the Action Code field to determine whether the available funds inquiry transaction was approved or denied.

A value of 000 is displayed in the Action Code field if the inquiry was approved. Various balances for the selected account are displayed in the BALANCE fields near the bottom of the screen. If an account has a negative balance, the amount may include a minus sign. Convey this information to the customer.

A value other than 000 is displayed in the Action Code field if the inquiry was denied. In this case, determine the appropriate action to take. Refer to the ***BASE24 Remote Banking Transaction Processing Manual*** for descriptions of all possible action codes.

If the balance inquiry was approved, you can cancel the transaction by pressing the **F6** key as long as the customer's financial institution allows approved nonfinancial transactions to be reversed. Press the **F6** key again to confirm the cancellation.

7. If the customer wants to perform another available funds inquiry using a different account or accounts, press the **F7** key to change the account type. The Transaction Selection screen is displayed. Repeat steps 3 through 6 to display the current balance of one account or perform the procedure for "Displaying the Balance of Two Accounts" to display the balance of two accounts.
8. If the customer wants to perform a different transaction, press the **F4** key to display the Transaction Menu.
9. If you have completed all transactions requested by this customer, press the **F2** key to display the Customer Verify Request screen in preparation for the next customer call.

Displaying the Available Balance of Two Accounts

The following procedure enables you to display the current available balance of two customer accounts.

Assumptions:

- The customer has been verified for the current call.
- The customer accounts have been configured.
- The customer is allowed to perform an available funds inquiry transaction.

To enter an available funds inquiry transaction on two accounts, perform the following:

1. From any CSR screen, press the **F4** key to display the Transaction Menu.
2. Select the AVAILABLE FUNDS INQUIRY transaction. The Transaction Selection screen is displayed.
3. On the Transaction Selection screen, select the account types on which the available funds inquiry transaction is to be performed (e.g., AVAIL FUNDS INQUIRY, SAV/DDA). Authorization Request screen 1 (dual available balance inquiry) is displayed.
4. Optionally enter the account number or account qualifier of the first account in the ACCOUNT 1 NUMBER and ACCOUNT 1 QUALIFIER fields, if this is known. Otherwise, the system will attempt to automatically select the account from the account type specified when you authorize the transaction.
5. Optionally enter the account number or account qualifier of the second account in the ACCOUNT 2 NUMBER and ACCOUNT 2 QUALIFIER fields, if this is known. Otherwise, the system will attempt to automatically select the account from the account type specified when you authorize the transaction.
6. Press the **F5** key to authorize the transaction.
 - a. If the customer has two or more accounts for the first account number or account type specified and multiple account selection is not enabled, the system automatically selects which account to use based on an account selection hierarchy. If multiple account selection is enabled, the Account Selection screen is displayed. Select the individual account on which the balance inquiry is to be performed. The account number and qualifier are returned and displayed in the ACCOUNT 1 NUMBER and ACCOUNT 1 QUALIFIER fields on Authorization Request screen 1 (dual available balance inquiry).

- b. If the customer has two or more accounts for the second account number or account type specified and multiple account selection is not enabled, the system automatically selects which account to use based on an account selection hierarchy. If multiple account selection is enabled, the Account Selection screen is displayed. Select the individual account on which the balance inquiry is to be performed. The account number and qualifier are returned and displayed in the ACCOUNT 2 NUMBER and ACCOUNT 2 QUALIFIER fields on Authorization Request screen 1 (dual available balance inquiry).
7. Authorization Response screen 1 is displayed. This screen overlays the bottom half of the original Authorization Request screen. Check the value of the Action Code field to determine whether the balance inquiry was approved or denied.

A value of 000 is displayed in the Action Code field if the inquiry was approved. Various balances for the selected accounts are displayed in the BALANCE fields near the bottom of the screen. If an account has a negative balance, the amount may include a minus sign. Convey this information to the customer.

A value other than 000 is displayed in the Action Code field if the inquiry was denied. In this case, determine the appropriate action to take. Refer to the ***BASE24 Remote Banking Transaction Processing Manual*** for descriptions of all possible action codes.

If the balance inquiry was approved, you can cancel the transaction by pressing the **F6** key as long as the customer's financial institution allows nonfinancial transactions to be reversed. Press the **F6** key again to confirm the cancellation.
8. If the customer wants to perform another available funds inquiry using a different account or accounts, press the **F7** key to change the account type. The Transaction Selection screen is displayed. Repeat steps 3 through 7 to display the current balance of two accounts or perform the procedure for "Displaying the Balance of One Account" to display the balance of one account.
9. If the customer wants to perform a different transaction, press the **F4** key to display the Transaction Menu.
10. If you have completed all transactions requested by this customer, press the **F2** key to display the Customer Verify Request screen in preparation for the next customer call.

Displaying the Available Balance of All (Multiple) Customer Accounts

The following procedure enables you to display the available balance or credit for all active application accounts currently configured for the customer. Transactions can only be performed on active accounts.

Assumptions:

- The customer has been verified for the current call.
- The customer accounts have been configured and verified.
- The customer is allowed to perform an account list inquiry with balances transaction.

To display the available balance or credit for all active accounts for a customer, perform the following:

1. From any CSR screen, press the **F4** key to display the Transaction Menu.
2. Select the ACCOUNT LIST INQ WITH BALANCES transaction. Authorization Request screen 1 (account list inquiry/account list inquiry with balances) is displayed.
3. Press the **F5** key to authorize the transaction.
 - a. If the account list inquiry with balances transaction is approved, Account List Inquiry with Balances Response screen 1 is displayed. This screen overlays the bottom half of the original Authorization Request screen.
 - 1) Up to three active account balances are displayed near the bottom of the screen. Convey this account balance information to the customer. Only accounts with a nonclosed status value in the STAT field and an effective date range that includes the current date are displayed.
 - 2) If more than three active accounts exist, a message indicating that there is more account information available will be displayed near the bottom of the screen. Press the **Shift-F8** keys to display the next three active accounts. You can continue to press the **Shift-F8** keys to display more active accounts until a message indicating that there are no more accounts is displayed.
 - 3) If the customer's financial institution allows nonfinancial transactions to be canceled, you can cancel the account list inquiry with balances transaction by pressing the **F6** key. Press the **F6** key again to confirm the cancellation.

- b. If the account list inquiry with balances transaction is denied, Authorization Response screen 1 is displayed. This screen overlays the bottom half of the original Authorization Request screen.

Check the value of the Action Code field to determine the reason the transaction was denied and take the appropriate action. Refer to the ***BASE24 Remote Banking Transaction Processing Manual*** for descriptions of all possible action codes.

- 4. If the customer wants to perform a different transaction, press the **F4** key to display the Transaction Menu.
- 5. If you have completed all transactions requested by this customer, press the **F2** key to display the Customer Verify Request screen in preparation for the next customer call.

Managing Customer Accounts

This subsection contains the following procedures:

- Listing all customer accounts
- Modifying a customer account
- Activating or deactivating a customer account

Listing All Customer Accounts

Customer accounts can be listed in two ways, depending on the BASE24 Remote Banking products installed on your system. BASE24-telebanking users can list customer accounts only by selecting the ACCOUNT LIST INQUIRY transaction on the Transaction Menu. Enhanced Telebanking and BASE24-billpay users can also list customer accounts by accessing the Customer Account List screen from the Customer Information screen.

BASE24-telebanking Procedure

The following procedure enables you to list all active application accounts currently configured for the customer. Transactions can only be performed on active accounts.

Assumptions:

- The customer has been verified for the current call.
- The customer accounts have been configured and verified.
- The customer is allowed to perform a customer account list inquiry transaction.

To list all active accounts for a customer, perform the following:

1. From any CSR screen, press the **F4** key to display the Transaction Menu.
2. Select the ACCOUNT LIST INQUIRY transaction. Authorization Request screen 1 (account list inquiry) is displayed.
3. Press the **F5** key to authorize the transaction.
 - If the customer account list inquiry transaction is approved, Account List Inquiry Response screen 1 is displayed. This screen overlays the bottom half of the original Authorization Request screen.

Up to five active accounts are displayed near the bottom of the screen. Convey this account information to the customer. Only accounts with a nonclosed status value in the STAT field and an effective date range that includes the current date are displayed.

If more than five active accounts exist, a message indicating that there are more accounts will be displayed near the bottom of the screen. Press the **Shift-F8** keys to display the next five active accounts. You can continue to press the **Shift-F8** keys to display more active accounts until a message indicating that there are no more accounts is displayed.

If the customer's financial institution allows nonfinancial transactions to be canceled, you can cancel the account list inquiry transaction by pressing the **F6** key. Press the **F6** key again to confirm the cancellation.

- If the account list inquiry transaction is denied, Authorization Response screen 1 is displayed. This screen overlays the bottom half of the original Authorization Request screen.

Check the value of the Action Code field to determine the reason the transaction was denied and take the appropriate action. Refer to the ***BASE24 Remote Banking Transaction Processing Manual*** for descriptions of all possible action codes.

4. If the customer wants to perform a different transaction, press the **F4** key to display the Transaction Menu.
5. If you have completed all transactions requested by this customer, press the **F2** key to display the Customer Verify Request screen in preparation for the next customer call.

Enhanced Telebanking and BASE24-billpay Procedure

The following procedure enables you to list all application accounts currently configured for the customer.

Assumptions:

- The customer has been verified for the current call.
- The customer accounts have been configured.
- The customer is allowed to perform a customer account list inquiry transaction.

To list accounts for a customer, perform the following:

1. From any CSR screen, press the **F4** key to display the Transaction Menu.
2. Select any customer transaction (e.g., CUSTOMER INQUIRY). The Customer Information screen is displayed.
3. On the Customer Information screen, press the **F13** key to display the Customer Account List screen. Use the **Shift-F7** and **Shift-F8** keys to scroll through the accounts as needed.
4. If the customer wants to perform a different transaction, press the **F4** key to display the Transaction Menu.

5. If you have completed all transactions requested by this customer, press the **F2** key to display the Customer Verify Request screen in preparation for the next customer call.

Modifying a Customer Account

The following procedure enables you to add, update, or delete a customer account.

Assumptions:

- The customer has been verified for the current call.
- The customer accounts have been configured.
- The customer is allowed to perform a customer account add, customer account delete, and customer account update transaction.

To modify an account for a customer, perform the following:

1. From any CSR screen, press the **F4** key to display the Transaction Menu.
2. Select any customer transaction (e.g., CUSTOMER UPDATE). The Customer Information screen is displayed.
3. On the Customer Information screen, press the **F13** key to display the Customer Account List screen.
4. At this point, you can perform any one of the following functions:
 - Add a new customer account. Enter values in the New: Account Number, Type, and Allowed fields. Optionally enter values in the New: Description and Qualifier fields. After all desired data is entered, press the **F5** key to add the account.

Default data configured on behalf of the customer's financial institution is used to fill in data for the following fields for the account: Status, Begin, and End.

Depending upon the policies of your organization, any accounts you enter on this screen may need to be verified by back-office personnel before they can be used in processing. In which case, the back-office personnel will activate the accounts after they have been successfully verified. If needed, inform the customer that they cannot use their accounts until after they have been verified and activated.
 - Update a customer account. You can update the Description, Qualifier, and Allowed: DB, CR, and INQ fields. Position the cursor on the account to be updated, modify the desired fields, and press the **F8** key.
 - Delete a customer account. You can only delete accounts with a status of Initial. Position the cursor on the account to be deleted, and press the **F13** key.

5. If the customer wants to perform a different transaction, press the **F4** key to display the Transaction Menu.
6. If you have completed all transactions requested by this customer, press the **F2** key to display the Customer Verify Request screen in preparation for the next customer call.

Activating or Deactivating a Customer Account

The following procedure enables you to activate or deactivate a customer account.

Assumptions:

- The customer has been verified for the current call.
- The customer accounts have been configured.
- The customer is allowed to perform a customer account activate and customer account deactivate transaction.

To activate or deactivate a customer account, perform the following:

1. From any CSR screen, press the **F4** key to display the Transaction Menu. Select any customer transaction (e.g., CUSTOMER ACTIVATE). The Customer Information screen is displayed.
2. On the Customer Information screen, press the **F13** key to display the Customer Account List screen.
3. At this point, you can perform either of the following functions:
 - Activate a customer account. Position the cursor on the account to be activated and press the **F15** key. Activation of a customer account changes the value of the Begin field to the current date and the value of the End field to the value from the default customer account for the customer's financial institution. The customer's ID must be activated before a customer account can be activated.
 - Deactivate a customer account. Position the cursor on the account to be deactivated and press the **F6** key. Deactivation of a customer account changes the value of the End field to the current date minus one day.
4. If the customer wants to perform a different transaction, press the **F4** key to display the Transaction Menu.
5. If you have completed all transactions requested by this customer, press the **F2** key to display the Customer Verify Request screen in preparation for the next customer call.

Entering and Managing Payments

This subsection contains the following procedures:

- Entering an immediate scheduled payment
- Entering a future scheduled payment
- Entering a recurring scheduled payment
- Changing a scheduled payment
- Skipping the next payment period for a recurring scheduled payment
- Deleting a scheduled payment

Procedures for displaying currently scheduled payments can be found in the “Displaying Scheduled Transactions” procedures provided elsewhere in this section.

Procedures for displaying completed payments can be found in the “Displaying Previous Transactions” procedures provided elsewhere in this section.

Entering an Immediate Scheduled Payment

The following procedure enables you to enter an immediate scheduled payment on behalf of the customer.

- Assumptions:
- The customer has been verified for the current call.
 - The customer vendor has been configured.
 - The customer is allowed to perform a schedule payment – immediate transaction.

To enter an immediate scheduled payment, perform the following:

1. Access the New Payment screen, as follows:
 - On the Transaction Menu, select the SCHEDULE PAYMENT – IMMEDIATE transaction.
 - On the Customer Information, Customer Vendor Detail, or Scheduled Transactions screens, press the **Shift-F1** keys.

In either case, the New Payment screen is displayed.
2. If the ACCT NUMBER field is blank or if you need to change to a different account from which the payment is to be withdrawn, perform the following:
 - a. Press the **Shift-F4** keys to display the Customer Account List screen.
 - b. On the Customer Account List screen, position the cursor next to the account from which the payment is to be withdrawn (the customer *from* account). If the account to be used is not defined to the system, you can enter the account number information (i.e., account number and account type, or account qualifier) on the first line of account information.
 - c. Press the **F1** key to select the account and return it to the New Payment screen. The account number will be displayed in the ACCT NUMBER field and in the Cust From Account field.
3. If known, enter the number of the customer vendor to which this customer wants to make a payment in the CustVend Number field. If the customer vendor number is not known, perform the following:
 - a. Press the **Shift-F5** keys to display a list of all customer vendors available for the customer for this payment on the Customer Vendor List screen. Use the **Shift-F7** and **Shift-F8** keys to scroll through the list as needed.
 - b. Position the cursor next to the customer vendor to receive the payment.

- c. Press the **F1** key to select the customer vendor and return it to the New Payment screen. The selected customer vendor number is displayed in the CustVend Number field, the name of the vendor is displayed in the Vendor Name field, and the customer's account with the vendor is displayed in the Acct With Vendor field. If any vendor-specific data is required for the vendor, a description is displayed in the Vend Specific Desc field.
4. Enter the amount of the payment in whole and fractional currency units (e.g., U.S. dollars and cents) in the Transaction Amount field.
5. Set the value of the Payment Type field to I if this value is not already displayed in the field.
6. Enter the appropriate vendor-specific data in the Vendor Specific Data field if the Vend Specific Desc field displays a value.
7. Press the **F5** key to enter the payment.
8. Check the response information displayed near the bottom of the screen to determine whether the payment was approved or denied. If you need to display an approved immediate scheduled payment after it has completed, see the procedures for "Displaying Previous Transactions" provided elsewhere in this section.
 - If the payment was not approved, take the action appropriate to the displayed action code. Refer to the ***BASE24 Remote Banking Transaction Processing Manual*** for descriptions of all possible action codes. If you need to reenter the transaction, press the **F1** key to clear the screen first, and repeat steps 2 through 8.
 - If the payment was approved, you have the option of canceling it by pressing the **F6** key before a configurable number of minutes (the default is 15 minutes) have elapsed since the payment was approved and before you exit this screen. Press the **F6** key again to confirm the cancellation.

For detailed information on how this time period is configured, refer to the BP-LAG-TIME param description in the ***BASE24 Logical Network Configuration File Manual***.
9. If you need to enter another payment for this customer, press the **F1** key to clear the screen first, and repeat steps 2 through 8.
10. If the customer wants to perform a different transaction, press the **F4** key to display the Transaction Menu.
11. If you have completed all transactions requested by this customer, press the **F2** key to display the Customer Verify Request screen in preparation for the next customer call.

Entering a Future Scheduled Payment

The following procedure enables you to enter a future scheduled payment on behalf of the customer.

- Assumptions:
- The customer has been verified for the current call.
 - The customer vendor has been configured.
 - The customer is allowed to perform a schedule payment – future transaction.

To enter a future scheduled payment, perform the following:

1. Access the New Payment screen, as follows:
 - On the Transaction Menu, select the SCHEDULE PAYMENT – FUTURE transaction.
 - On the Customer Information, Customer Vendor Detail, or Scheduled Transactions screens, press the **Shift-F1** keys.

In either case, the New Payment screen is displayed.
2. If the ACCT NUMBER field is blank or if you need to change to a different account from which the payment is to be withdrawn, perform the following:
 - a. Press the **Shift-F4** keys to display the Customer Account List screen.
 - b. On the Customer Account List screen, position the cursor next to the account from which the payment is to be withdrawn (the customer *from* account). If the account to be used is not defined to the system, you can enter the account number information (i.e., account number and account type, or account qualifier) on the first line of account information.
 - c. Press the **F1** key to select the account and return it to the New Payment screen. The account number will be displayed in the ACCT NUMBER field and in the Cust From Account field.
3. If known, enter the number of the customer vendor to which this customer wants to make a payment in the CustVend Number field. If the customer vendor number is not known, perform the following:
 - a. Press the **Shift-F5** keys to display a list of all customer vendors available for the customer for this payment on the Customer Vendor List screen. Use the **Shift-F7** and **Shift-F8** keys to scroll through the list as needed.
 - b. Position the cursor next to the customer vendor to receive the payment.

- c. Press the **F1** key to select the customer vendor and return it to the New Payment screen. The selected customer vendor number is displayed in the CustVend Number field, the name of the vendor is displayed in the Vendor Name field, and the customer's account with the vendor is displayed in the Acct With Vendor field. If any vendor-specific data is required for the vendor, a description is displayed in the Vend Specific Desc field.
4. Enter the amount of the payment in whole and fractional currency units (e.g., U.S. dollars and cents) in the Transaction Amount field.
5. Set the value of the Payment Type field to F if this value is not already displayed in the field.
6. Enter the date on which the payment is to be made in the First Payment Date field. The format in which the date should be entered is displayed to the right of the First Payment Date field on the screen.
7. Enter the appropriate vendor-specific data in the Vendor Specific Data field if the Vend Specific Desc field displays a value.
8. Press the **F5** key to enter the payment.
9. Check the response information displayed near the bottom of the screen to determine whether the payment was approved or denied. A message indicating that the transaction was approved is displayed if the payment was approved. If you need to display an approved and currently scheduled future payment at a later time, see the procedures for "Displaying Currently Scheduled Transactions" provided elsewhere in this section. If you need to display an approved scheduled future payment after it has completed, see the procedures for "Displaying Previous Transactions" provided elsewhere in this section.
 - If the payment is denied, check the response information displayed near the bottom of the screen to determine the appropriate action to take. Refer to the ***BASE24 Remote Banking Transaction Processing Manual*** for descriptions of all possible action codes. If you need to reenter the transaction, press the **F1** key to clear the screen first, and repeat steps 2 through 9.
 - If the payment was approved, the first Scheduled Payment Detail screen is displayed. You can review the information on the Scheduled Payment Detail screens with the customer. Make changes as necessary to the information on Scheduled Payment Detail screen 1. When all information on this screen is correct, press the **F9** key to display the second Scheduled Payment Detail screen. Review the information on

this screen with the customer, making changes as necessary. If you made changes to the information on either screen, press the **F8** key to save the information.

10. If you need to enter another payment for this customer, press the **F16** key to return to the New Payment screen, and repeat steps 2 through 9.
11. If the customer wants to perform a different transaction, press the **F4** key to display the Transaction Menu.
12. If you have completed all transactions requested by this customer, press the **F2** key to display the Customer Verify Request screen in preparation for the next customer call.

Entering a Recurring Scheduled Payment

The following procedure enables you to enter a recurring scheduled payment on behalf of the customer.

Assumptions:

- The customer has been verified for the current call.
- The customer vendor has been configured.
- The customer is allowed to perform schedule payment – recurring transaction.

To enter a recurring scheduled payment, perform the following:

1. Access the New Payment screen, as follows:
 - On the Transaction Menu, select the SCHEDULE PAYMENT – RECURRING transaction.
 - On the Customer Information, Customer Vendor Detail, or Scheduled Transactions screens, press the **Shift-F1** keys.

In either case, the New Payment screen is displayed.
2. If the ACCT NUMBER field is blank or if you need to change to a different account from which the payment is to be withdrawn, perform the following:
 - a. Press the **Shift-F4** keys to display the Customer Account List screen.
 - b. On the Customer Account List screen, position the cursor next to the account from which the payments are to be withdrawn (the customer *from* account). If the account to be used is not defined to the system, you can enter the account number information (i.e., account number and account type, or account qualifier) on the first line of account information.
 - c. Press the **F1** key to select the account and return it to the New Payment screen. The account number will be displayed in the ACCT NUMBER field and the Cust From Account field.
3. If known, enter the number of the customer vendor to which this customer wants to make a payment in the CustVend Number field. If the customer vendor number is not known, perform the following:
 - a. Press the **Shift-F5** keys to display a list of all customer vendors available for the customer for this payment on the Customer Vendor List screen. Use the **Shift-F7** and **Shift-F8** keys to scroll through the list as needed.
 - b. Position the cursor next to the customer vendor to receive the payment.

- c. Press the **F1** key to select the customer vendor and return it to the New Payment screen. The selected customer vendor number is displayed in the CustVend Number field, the name of the vendor is displayed in the Vendor Name field, and the customer's account with the vendor is displayed in the Acct With Vendor field. If any vendor-specific data is required for the vendor, a description is displayed in the Vend Specific Desc field.
4. Enter the amount of each payment in whole and fractional currency units (e.g., U.S. dollars and cents) in the Transaction Amount field.
5. Set the value of the Payment Type field to R if this value is not already displayed in the field.
6. Enter the date on which the first payment is to be made in the First Payment Date field. The format in which the date should be entered is displayed to the right of the First Payment Date field value on the screen.
7. Enter the appropriate vendor-specific data in the Vendor Specific Data field if the Vend Specific Desc field displays a value.
8. Enter the total number of payments to make in the Total Number of Payments to Make field.
9. Enter the period on which the recurring payment is to be based in the Recurring Period field.
10. Press the **F5** key to enter the payment.
11. Check the response information displayed near the bottom of the screen to determine whether the payment was approved or denied. A message indicating that the transaction was approved is displayed if the payment was approved. If you need to display an approved and currently scheduled recurring payment at a later time, see the procedures for "Displaying Currently Scheduled Transactions" provided elsewhere in this section. If you need to display an approved scheduled payment after it has completed, see the procedures for "Displaying Previous Transactions" provided elsewhere in this section.
 - If the payment is denied, check the response information displayed near the bottom of the screen to determine the appropriate action to take. Refer to the ***BASE24 Remote Banking Transaction Processing Manual*** for descriptions of all possible action codes. If you need to reenter the transaction, press the **F1** key to clear the screen first, and repeat steps 2 through 11.
 - If the payment was approved, the first Scheduled Payment Detail screen is displayed. You can review the information on the Scheduled Payment Detail screens with the customer. Make changes as necessary to the

information on Scheduled Payment Detail screen 1. When all information on this screen is correct, press the **F9** key to display the second Scheduled Payment Detail screen. Review the information on this screen with the customer, making changes as necessary. If you made changes to the information on either screen, press the **F8** key to save the information.

12. If you need to enter another payment for this customer, press the **F16** key to return to the New Payment screen, and repeat steps 2 through 11.
13. If the customer wants to perform a different transaction, press the **F4** key to display the Transaction Menu.
14. If you have completed all transactions requested by this customer, press the **F2** key to display the Customer Verify Request screen in preparation for the next customer call.

Changing a Scheduled Payment

The following procedure enables you to change certain parameters for a scheduled payment on behalf of the customer.

- Assumptions:
- The customer has been verified for the current call.
 - The scheduled payment to be updated has already been entered and has not yet expired.
 - The customer is allowed to perform scheduled payment update transactions.

To change a scheduled payment, perform the following:

1. Access the Scheduled Transactions screen, as follows:
 - On any CSR screen, press the **F4** key to display the Transaction Menu, then select any scheduled payment transaction (e.g., SCHEDULED PAYMENT UPDATE).
 - On the Customer Information screen, press the **Shift-F4** keys.In either case, the Scheduled Transactions screen is displayed.
2. On the Scheduled Transactions screen, use the QUERY fields and the **Shift-F7** and **Shift-F8** keys until you find the scheduled payment the customer wants to change. Scheduled payments are identified by a value of BLPY in the Tran Type field.
3. Display transaction detail for the payment transaction by positioning the cursor next to the transaction entry and pressing the **F1** key. The Scheduled Payment Detail screen is displayed.
4. Press the **F9** key to display the second page of the Scheduled Payment Detail screen and check the value displayed in the Processing Status field. You cannot change a scheduled transaction while this field displays a value of PA (pending authorization) or RP (retry pending). If one of these values are displayed, you can try waiting a few seconds and then repeat steps 2 through 4, or have the customer call back at a later time. If the Processing Status field is set to any other value, press the **F11** key and continue with the next step.
5. Enter the data the customer wants to change in the Change Tran fields displayed near the bottom of the screen and press the **F8** key. Check the message displayed at the bottom of the screen to determine whether the change was successful.

- For a future scheduled payment, you can change the amount of the payment (Amt field), the date on which the payment will occur (Next Date field), and any vendor-specific data associated with the vendor (Vend Specific Data field).
 - For a recurring scheduled payment, you can change any data. If you change the total number of recurring payments, it must be changed to a value that is greater than the number of payments already made.
6. If you need to change another scheduled payment for this customer, repeat steps 2 through 5.
 7. If the customer wants to perform a different transaction, press the **F4** key to display the Transaction Menu.
 8. If you have completed all transactions requested by this customer, press the **F2** key to display the Customer Verify Request screen in preparation for the next customer call.

Skipping the Next Payment Period for a Recurring Scheduled Payment

The following procedure enables you to skip the next payment period for a recurring scheduled payment on behalf of the customer.

Assumptions:

- The customer has been verified for the current call.
- The recurring scheduled payment has already been entered and has not yet expired.
- The customer is allowed to perform scheduled payment update transactions.

To skip the next payment period for a recurring scheduled payment, perform the following:

1. Access the Scheduled Transactions screen, as follows:
 - On any CSR screen, press the **F4** key to display the Transaction Menu, then select any scheduled payment transaction (e.g., SCHEDULED PAYMENT UPDATE).
 - On the Customer Information screen, press the **Shift-F4** keys.

In either case, the Scheduled Transactions screen is displayed.

2. On the Scheduled Transactions screen, use the QUERY fields and the **Shift-F7** and **Shift-F8** keys until you find the recurring scheduled payment for which the customer wants to skip the next payment. Scheduled payments are identified by a value of BLPY in the Tran Type field. Recurring scheduled payments also have values displayed in the Recur: Period and Recur: Remaining fields. The date of the next payment to be made is displayed in the NextAction field.
3. Position the cursor on the recurring scheduled payment entry and press the **Shift-F6** keys to skip the next scheduled payment. Check the message displayed at the bottom of the screen to determine whether the change was successful. If successful, continue with step 4. If the change was not successful, the transaction may be in a processing state that does not allow the transaction to be changed. In this case, you can perform the following to check the processing status of the transaction:
 - a. Display transaction detail for the recurring scheduled payment transaction by positioning the cursor on the transaction entry and pressing the **F1** key. The Scheduled Payment Detail screen is displayed.
 - b. Press the **F9** key to display the second page of the Scheduled Payment Detail screen and check the value displayed in the Processing Status field. You cannot skip a payment period while this field displays a value of PA (pending authorization) or RP (retry pending). If it does, you can try waiting a few seconds and then repeat steps 2 and 3, or have the customer call back at a later time. If the Processing Status field is set to any other value, press the **Shift-F6** keys to skip the next payment.
4. If you need to skip the next payment for another recurring scheduled payment for this customer, repeat steps 2 and 3.
5. If the customer wants to perform a different transaction, press the **F4** key to display the Transaction Menu.
6. If you have completed all transactions requested by this customer, press the **F2** key to display the Customer Verify Request screen in preparation for the next customer call.

Deleting a Scheduled Payment

The following procedure enables you to delete a scheduled payment on behalf of the customer.

- Assumptions:
- The customer has been verified for the current call.
 - The scheduled payment has already been entered and has not yet completed.
 - The customer is allowed to perform scheduled payment delete transactions.

To delete a scheduled payment, perform the following:

1. Access the Scheduled Transactions screen, as follows:
 - On any CSR screen, press the **F4** key to display the Transaction Menu, then select any scheduled payment transaction (e.g., SCHEDULED PAYMENT DELETE).
 - On the Customer Information screen, press the **Shift-F4** keys.

In either case, the Scheduled Transactions screen is displayed.
2. On the Scheduled Transactions screen, use the QUERY fields and the **Shift-F7** and **Shift-F8** keys until you find the scheduled payment the customer wants to delete. Scheduled payments are identified by a value of BLPY in the Tran Type field. Recurring scheduled payments also have values displayed in the Recur: Period and Recur: Remaining fields.
3. Position the cursor next to the scheduled payment entry and press the **F6** key to delete the scheduled payment. Press the **F6** key again to confirm the deletion. Check the message displayed at the bottom of the screen to determine whether the transaction was successfully deleted. If successful, continue with step 4. If the transaction was not successfully deleted, the transaction may be in a processing state that does not allow the transaction to be deleted. In this case, you can perform the following to check the processing status of the transaction:
 - a. Display transaction detail for the recurring scheduled payment transaction by positioning the cursor on the transaction entry and pressing the **F1** key. The Scheduled Payment Detail screen is displayed.

- b. Press the **F9** key to display the second page of the Scheduled Payment Detail screen and check the value displayed in the Processing Status field. You cannot delete a scheduled payment while this field displays a value of PA (pending authorization) or RP (retry pending). If it does, you can try waiting a few seconds and then repeat steps 2 and 3, or have the customer call back at a later time. If the Processing Status field is set to any other value, press the **F6** key to delete the transaction. Press the **F6** key again to confirm the deletion.
4. If you need to delete another scheduled payment for this customer, repeat steps 2 and 3.
5. If the customer wants to perform a different transaction, press the **F4** key to display the Transaction Menu.
6. If you have completed all transactions requested by this customer, press the **F2** key to display the Customer Verify Request screen in preparation for the next customer call.

Entering and Managing Transfers

This subsection contains the following procedures:

- Entering an immediate transfer
- Entering a future scheduled transfer
- Entering a recurring scheduled transfer
- Changing a scheduled transfer
- Skipping the next transfer period for a recurring scheduled transfer
- Deleting a scheduled transfer

Procedures for displaying currently scheduled transfers can be found in the “Displaying Scheduled Transactions” procedures provided elsewhere in this section.

Procedures for displaying completed transfers can be found in the “Displaying Previous Transactions” procedures provided elsewhere in this section.

Note: These procedures only allow you to perform internal transfers between two accounts owned by the same financial institution. If you need to perform an external transfer between two accounts owned by different financial institutions, the transfer must be performed as a payment. In this case, the financial institution owning the *to* account must be configured as a customer vendor with the *to* account configured as the account with vendor. For more information, see the procedures for “Adding a Customer Vendor” and “Entering Payments” provided elsewhere in this section.

Entering an Immediate Transfer

The following procedure enables you to enter an immediate transfer between two accounts on behalf of the customer.

Assumptions: The customer has been verified for the current call.
 The customer is allowed to perform transfer – immediate transactions.

To enter an immediate transfer between two accounts, perform the following:

1. From any CSR screen, press the **F4** key to display the Transaction Menu.
2. Select the TRANSFER IMMEDIATE transaction. The Transaction Selection screen is displayed.
3. On the Transaction Selection screen, select the account types on which the transfer is to be performed (e.g., TRANSFER SAV, DDA). The account type for the *from* account is listed first, followed by the *to* account. Authorization Request screen 1 (transfer or user-defined) is displayed.
4. Enter the amount of the transfer in whole and fractional currency units (e.g., U.S. dollars and cents) in the TRANSACTION AMOUNT field.
5. Optionally enter the account number or account qualifier of the *from* account in the ACCOUNT 1 NUMBER and ACCOUNT 1 QUALIFIER fields, if this is known. If you do not enter a value, the system will attempt to determine the individual *from* account according to the specified account type when you authorize the transaction.
6. Optionally enter the account number or account qualifier of the *to* account in the ACCOUNT 2 NUMBER and ACCOUNT 2 QUALIFIER fields, if this is known. If you do not enter a value, the system will attempt to determine the individual *to* account according to the specified account type when you authorize the transaction.
7. Press the **F5** key to authorize the transaction.
 - a. If the customer has two or more *from* accounts of the account number or account type specified and multiple account selection is not enabled, the system automatically selects the account to use based on an account selection hierarchy. If multiple account selection is enabled, the Account Selection screen is displayed. Select the individual account from which the transfer is to be made. The account number and qualifier are returned and displayed in the ACCOUNT 1 NUMBER and ACCOUNT 1 QUALIFIER fields on Authorization Request screen 1 (transfer or user-defined).

- b. If the customer has two or more *to* accounts of the account number or account type specified and multiple account selection is not enabled, the system automatically selects the account to use based on an account selection hierarchy. If multiple account selection is enabled, the Account Selection screen is displayed. Select the individual account from which the transfer is to be made. The account number and qualifier are returned and displayed in the ACCOUNT 2 NUMBER and ACCOUNT 2 QUALIFIER fields on Authorization Request screen 1 (transfer or user-defined).
8. Authorization Response screen 1 is displayed. This screen overlays the bottom half of the original Authorization Request screen. Check the Action Code field to determine whether the transfer was approved or denied.

A value of 000 is displayed in the Action Code field if the transfer was approved. If you need to display an approved transfer at a later time, see the procedures for “Displaying Previous Transactions” provided elsewhere in this section.

A value other than 000 is displayed in the Action Code field if the transfer was denied. In this case, determine the appropriate action to take. Refer to the ***BASE24 Remote Banking Transaction Processing Manual*** for descriptions of all possible action codes.

If the transfer was approved, you can cancel the transaction by pressing the **F6** key. Press the **F6** key again to confirm the cancellation.
9. If the customer wants to perform another transfer, but using different accounts, press the **F7** key to change the account types. The Transaction Selection screen is displayed. Repeat steps 3 through 8 to complete the transfer.
10. If the customer wants to perform a different transaction, press the **F4** key to display the Transaction Menu.
11. If you have completed all transactions requested by this customer, press the **F2** key to display the Customer Verify Request screen in preparation for the next customer call.

Entering a Future Scheduled Transfer

The following procedure enables you to enter a future scheduled transfer between two accounts on behalf of the customer.

Assumptions: The customer has been verified for the current call.
 The customer is allowed to perform schedule transfer – future transactions.

To enter a future scheduled transfer between two accounts, perform the following:

1. Access the New Transfer screen, as follows:
 - On the Transaction Menu, select any scheduled transfer transaction (e.g., SCHEDULE TRANSFER – FUTURE).
 - On the Customer Information or Scheduled Transactions screens, press the **Shift-F2** keys.

In either case, the New Transfer screen is displayed.

2. If the From Account field is blank, perform the following:
 - a. Press the **Shift-F4** keys to display the Customer Account List screen.
 - b. On the Customer Account List screen, position the cursor next to the account from which the transfer is to be made. If the account to be used is not defined to the system, you can enter the account number information (i.e., account number and account type, or account qualifier) in the first line of account information.
 - c. Press the **F1** key to select the account and return it to the New Transfer screen. The account number will be displayed in the ACCT NUMBER and From Account fields.
3. If the To Account field is blank, perform the following:
 - a. Press the **Shift-F5** keys to display the Customer Account List screen.
 - b. On the Customer Account List screen, position the cursor next to the account to which the transfer is to be made. If the account to be used is not defined to the system, you can enter the account number information (i.e., account number and account type, or account qualifier) in the first line of account information.
 - c. Press the **F1** key to select the account and return it to the New Transfer screen. The account number will be displayed in the To Account field.

4. Enter the amount of the transfer in whole and fractional currency units (e.g., U.S. dollars and cents) in the Transaction Amount field.
5. Set the value of the Transfer Type field to F if this value is not already displayed in the field.
6. Enter the date on which the transfer is to be made in the First Transfer Date field. The format in which the date should be entered is displayed to the right of the First Transfer Date field value on the screen.
7. Press the **F5** key to enter the future scheduled transfer.
8. Check the response information displayed near the bottom of the screen to determine whether the transfer was approved or denied. A message indicating that the transaction was approved is displayed if the transfer was approved. If you need to display an approved and currently scheduled transfer at a later time, see the procedures for “Displaying Currently Scheduled Transactions” provided elsewhere in this section. If you need to display an approved scheduled transfer after it has completed, see the procedures for “Displaying Previous Transactions” provided elsewhere in this section.
 - If the transfer is denied, check the response information displayed near the bottom of the screen to determine the appropriate action to take. Refer to the ***BASE24 Remote Banking Transaction Processing Manual*** for descriptions of all possible action codes. If needed, you can press the **F1** key to clear the screen before attempting to reenter the transfer or entering another transfer transaction.
 - If the transfer was approved, the first Scheduled Transfer Detail screen is displayed. You can review the information on the Scheduled Transfer Detail screens with the customer. Make changes as necessary to the information on Scheduled Transfer Detail screen 1. When all information on this screen is correct, press the **F9** key to display the second Scheduled Transfer Detail screen. Review the information on this screen with the customer, making changes as necessary. If you made changes to the information on either screen, press the **F8** key to save the information.
9. If you need to enter another scheduled transfer (future or recurring) for this customer, press the **F16** key to return to the New Transfer screen and repeat steps 2 through 8.
10. If the customer wants to perform a different transaction, press the **F4** key to display the Transaction Menu.
11. If you have completed all transactions requested by this customer, press the **F2** key to display the Customer Verify Request screen in preparation for the next customer call.

Entering a Recurring Scheduled Transfer

The following procedure enables you to enter a recurring scheduled transfer between two accounts on behalf of the customer.

Assumptions: The customer has been verified for the current call.
 The customer is allowed to perform a schedule transfer – recurring transaction.

To enter a recurring scheduled transfer between two accounts, perform the following:

1. Access the New Transfer screen, as follows:
 - On the Transaction Menu, select any scheduled transfer transaction (e.g., SCHEDULE TRANSFER – RECURRING).
 - On the Customer Information or Scheduled Transactions screens, press the **Shift-F2** keys.

In either case, the New Transfer screen is displayed.
2. If the From Account field is blank, perform the following:
 - a. Press the **Shift-F4** keys to display the Customer Account List screen.
 - b. On the Customer Account List screen, position the cursor next to the account from which the transfer is to be made. If the account to be used is not defined to the system, you can enter the account number information (i.e., account number and account type, or account qualifier) in the first line of account information.
 - c. Press the **F1** key to select the account and return it to the New Transfer screen. The account number will be displayed in the ACCT NUMBER and From Account fields.
3. If the To Account field is blank, perform the following:
 - a. Press the **Shift-F5** keys to display the Customer Account List screen.
 - b. On the Customer Account List screen, position the cursor next to the account to which the transfer is to be made. If the account to be used is not defined to the system, you can enter the account number information (i.e., account number and account type, or account qualifier) in the first line of account information.
 - c. Press the **F1** key to select the account and return it to the New Transfer screen. The account number will be displayed in the To Account field.

4. Enter the amount of the transfer in whole and fractional currency units (e.g., U.S. dollars and cents) in the Transaction Amount field.
5. Set the value of the Transfer Type field to R if this value is not already displayed in the field.
6. Enter the date on which the first transfer is to be made in the First Transfer Date field. The format in which the date should be entered is displayed to the right of the First Transfer Date field value on the screen.
7. Enter the total number of transfers to make in the Total Number of Transfers to Make field.
8. Enter the period on which the recurring transfer is to be based in the Recurring Period field.
9. Press the **F5** key to enter the transfer.
10. Check the response information displayed near the bottom of the screen to determine whether the transfer was approved or denied. A message indicating that the transaction was approved is displayed if the transfer was approved. If you need to display an approved and currently scheduled transfer at a later time, see the procedures for “Displaying Currently Scheduled Transactions” provided elsewhere in this section. If you need to display an approved scheduled transfer after it has completed, see the procedures for “Displaying Previous Transactions” provided elsewhere in this section.
 - If the transfer is denied, check the response information displayed near the bottom of the screen to determine the appropriate action to take. Refer to the ***BASE24 Remote Banking Transaction Processing Manual*** for descriptions of all possible action codes. If needed, you can press the **F1** key to clear the screen before attempting to reenter the transfer or enter another transfer transaction.
 - If the transfer was approved, the first Scheduled Transfer Detail screen is displayed. You can review the information on the Scheduled Transfer Detail screens with the customer. Make changes as necessary to the information on Scheduled Transfer Detail screen 1. When all information on this screen is correct, press the **F9** key to display the second Scheduled Transfer Detail screen. Review the information on this screen with the customer, making changes as necessary. If you made changes to the information on either screen, press the **F8** key to save the information.
11. If you need to enter another scheduled transfer (future or recurring) for this customer, press the **F16** key to return to the New Transfer screen and repeat steps 2 through 10.

12. If the customer wants to perform a different transaction, press the **F4** key to display the Transaction Menu.
13. If you have completed all transactions requested by this customer, press the **F2** key to display the Customer Verify Request screen in preparation for the next customer call.

Changing a Scheduled Transfer

The following procedure enables you to change certain parameters for a scheduled transfer on behalf of the customer.

- Assumptions:
- The customer has been verified for the current call.
 - The scheduled transfer to be updated has already been entered and has not yet expired.
 - The customer is allowed to perform scheduled transfer update transactions.

To update a scheduled transfer, perform the following:

1. Access the Scheduled Transactions screen, as follows:
 - On any CSR screen, press the **F4** key to display the Transaction Menu, then select any scheduled transfer transactions (e.g., SCHEDULED TRANSFER UPDATE).
 - On the Customer Information screen, press the **Shift-F4** keys.

In either case, the Scheduled Transactions screen is displayed.
2. On the Scheduled Transactions screen, use the QUERY fields and the **Shift-F7** and **Shift-F8** keys until you find the scheduled transfer the customer wants to change. Scheduled transfers are identified by a value of TRFR in the Tran Type field.
3. Display transaction detail for the transfer transaction by positioning the cursor next to the transaction entry and pressing the **F1** key. The Scheduled Transfer Detail screen is displayed.
4. Press the **F9** key to display the second page of the Scheduled Transfer Detail screen and check the value displayed in the Processing Status field. You cannot change a scheduled transaction while this field displays a value of PA (pending authorization) or RP (retry pending). If it does, you can try waiting a few seconds and then repeat steps 2 through 4, or have the customer call back at a later time. If the Processing Status field is set to any other value, press the **F11** key and continue with the next step.
5. Enter the data the customer wants to change in the Change Tran fields displayed near the bottom of the screen and press the **F8** key. Check the message displayed at the bottom of the screen to determine whether the change was successful.

- For a future scheduled transfer, you can change the amount of the payment (Amt field) and the date on which the transfer will occur (Next Date field).
 - For a recurring scheduled transfer, you can change any data. If you change the total number of recurring transfers, it must be changed to a value that is greater than the number of transfers already made.
6. If you need to change another scheduled transfer for this customer, press the **F16** key and repeat steps 2 through 5.
 7. If the customer wants to perform a different transaction, press the **F4** key to display the Transaction Menu.
 8. If you have completed all transactions requested by this customer, press the **F2** key to display the Customer Verify Request screen in preparation for the next customer call.

Skippping the Next Transfer Period for a Recurring Scheduled Transfer

The following procedure enables you to skip the next transfer period for a recurring scheduled transfer on behalf of the customer.

- Assumptions:
- The customer has been verified for the current call.
 - The recurring scheduled transfer has already been entered and has not yet expired.
 - The customer is allowed to perform scheduled transfer update transactions.

To skip the next transfer period for a recurring scheduled transfer, perform the following:

1. Access the Scheduled Transactions screen, as follows:
 - On any CSR screen, press the **F4** key to display the Transaction Menu, then select any scheduled transfer transaction (e.g., SCHEDULED TRANSFER UPDATE).
 - On the Customer Information screen, press the **Shift-F4** keys.

In either case, the Scheduled Transactions screen is displayed.
2. On the Scheduled Transactions screen, use the QUERY fields and the **Shift-F7** and **Shift-F8** keys until you find the recurring scheduled transfer for which the customer wants to skip the next transfer. Scheduled transfers

are identified by a value of TRFR in the Tran Type field. Recurring scheduled transfers also have values displayed in the Recur: Period and Recur: Remaining fields. The date of the next transfer to be made is displayed in the NextAction field.

3. Position the cursor next to the recurring scheduled transfer entry and press the **Shift-F6** keys to skip the next scheduled transfer. Check the message displayed at the bottom of the screen to determine whether the change was successful. If successful, continue with step 4. If the change was not successful, the transaction may be in a processing state that does not allow the transaction to be changed. In this case, you can perform the following to check the processing status of the transaction:
 - a. Display transaction detail for the recurring scheduled transfer transaction by positioning the cursor on the transaction entry and pressing the **F1** key. The Scheduled Transfer Detail screen is displayed.
 - b. Press the **F9** key to display the second page of the Scheduled Transfer Detail screen and check the value displayed in the Processing Status field. You cannot skip a transfer period while this field displays a value of PA (pending authorization) or RP (retry pending). If one of these values are displayed, you can try waiting a few seconds and then repeat steps 2 and 3, or have the customer call back at a later time. If the Processing Status field is set to any other value, press the **Shift-F6** keys to skip the next transfer.
4. If you need to skip a transfer for another recurring scheduled transfer for this customer, repeat steps 2 and 3.
5. If the customer wants to perform a different transaction, press the **F4** key to display the Transaction Menu.
6. If you have completed all transactions requested by this customer, press the **F2** key to display the Customer Verify Request screen in preparation for the next customer call.

Deleting a Scheduled Transfer

The following procedure enables you to delete a scheduled transfer on behalf of the customer.

- Assumptions:
- The customer has been verified for the current call.
 - The scheduled transfer has already been entered and has not yet expired.
 - The customer is allowed to perform scheduled transfer delete transactions.

To delete a scheduled transfer, perform the following:

1. Access the Scheduled Transactions screen, as follows:
 - On any CSR screen, press the **F4** key to display the Transaction Menu, then select any scheduled transfer transaction (e.g., SCHEDULED TRANSFER DELETE).
 - On the Customer Information screen, press the **Shift-F4** keys.

In either case, the Scheduled Transactions screen is displayed.
2. On the Scheduled Transactions screen, use the QUERY fields and the **Shift-F7** and **Shift-F8** keys until you find the scheduled transfer the customer wants to delete. Scheduled transfers are identified by a value of TRFR in the Tran Type field. Recurring scheduled transfers also have values displayed in the Recur: Period and Recur: Remaining fields.
3. Position the cursor next to the scheduled transfer entry and press the **F6** key to delete the scheduled transfer. Press the **F6** key again to confirm the deletion. Check the message displayed at the bottom of the screen to determine whether the transaction was successfully deleted. If successful, continue with step 4. If the deletion was not successful, the transaction may be in a processing state that does not allow the transaction to be deleted. In this case, you can perform the following to check the processing status of the transaction:
 - a. Display transaction detail for the recurring scheduled transfer transaction by positioning the cursor on the transaction entry and pressing the **F1** key. The Scheduled Transfer Detail screen is displayed.

- b. Press the **F9** key to display the second page of the Scheduled Transfer Detail screen and check the value displayed in the Processing Status field. You cannot delete a transfer while this field displays a value of PA (pending authorization) or RP (retry pending). If it does, you can try waiting a few seconds and then repeat steps 2 and 3, or have the customer call back at a later time. If the Processing Status field is set to any other value, press the **F6** key to delete the transaction. Press the **F6** key again to confirm the deletion.
4. If you need to delete another scheduled transfer for this customer, repeat steps 2 and 3.
5. If the customer wants to perform a different transaction, press the **F4** key to display the Transaction Menu.
6. If you have completed all transactions requested by this customer, press the **F2** key to display the Customer Verify Request screen in preparation for the next customer call.

Displaying Currently Scheduled Transactions

The following procedures allow you to display currently scheduled payment or transfer transactions for a customer. Procedures for the following functions are included:

- Displaying scheduled payments only
- Displaying scheduled transfers only
- Displaying both scheduled payments and transfers

Once the withdrawal or transfer of funds for a scheduled payment or transfer is made or attempted (including all retry processing), the payment or transfer is considered to be complete. You can display a completed payment or transfer by performing the “Displaying Completed Payments and Transfers” procedure provided elsewhere in this section.

Displaying Currently Scheduled Payments

The following procedure enables you to display currently scheduled payments on behalf of the customer.

- Assumptions:
- The customer has been verified for the current call.
 - The scheduled payments have already been entered and have not yet been completed.
 - The customer is allowed to perform a scheduled payments list inquiry transaction.

To display currently scheduled payments, perform the following:

1. On any CSR screen, press the **F4** key to display the Transaction Menu, then select any scheduled transactions inquiry transactions (e.g., SCHEDULED PAYMENTS INQUIRY). The Scheduled Transactions screen is displayed.
2. On the Scheduled Transactions screen, use the QUERY fields and the **Shift-F7** and **Shift-F8** keys to peruse all scheduled payments for the customer. Scheduled payments are identified by a value of BLPY in the Tran Type field. Recurring scheduled payments also have values displayed in the Recur: Period and Recur: Remaining fields. Convey the displayed information for each scheduled payment on which the customer wants to inquire. If the customer desires more detailed information for a particular transaction, perform the following steps:
 - a. Position the cursor next to the scheduled payment entry and press the **F1** key. The Scheduled Payment Detail screen is displayed.
 - b. On the Scheduled Payment Detail screen, review the detailed transaction data and convey the requested information to the customer. Use the **F9** and **F11** keys to move between both screens of transaction detail as needed.
 - c. If you need to view detailed information for another scheduled payment for this customer, press the **F16** key and repeat steps a and b.
3. If the customer wants to perform a different transaction, press the **F4** key to display the Transaction Menu.
4. If you have completed all transactions requested by this customer, press the **F2** key to display the Customer Verify Request screen in preparation for the next customer call.

Displaying Currently Scheduled Transfers

The following procedure enables you to display currently scheduled transfers on behalf of the customer.

- Assumptions:
- The customer has been verified for the current call.
 - The scheduled transfers have already been entered and have not yet expired.
 - The customer is allowed to perform a scheduled transfers list inquiry transaction.

To display currently scheduled transfers, perform the following:

1. On any CSR screen, press the **F4** key to display the Transaction Menu, then select any scheduled transactions inquiry transaction (e.g., SCHEDULED TRANSFERS INQUIRY). The Scheduled Transactions screen is displayed.
2. On the Scheduled Transactions screen, use the QUERY fields and the **Shift-F7** and **Shift-F8** keys to peruse all scheduled transfers for the customer. Scheduled payments are identified by a value of TRFR in the Tran Type field. Recurring scheduled transfers also have values displayed in the Recur: Period and Recur: Remaining fields. Convey the displayed information for each scheduled transfer on which the customer wants to inquire. If the customer desires more detailed information for a particular transaction, perform the following steps:
 - a. Position the cursor next to the scheduled transfer entry and press the **F1** key. The Scheduled Transfer Detail screen is displayed.
 - b. On the Scheduled Transfer Detail screen, review the detailed transaction data and convey the requested information to the customer. Use the **F9** and **F11** keys to move between both screens of transaction detail as needed.
 - c. If you need to view detailed information for another scheduled transfer for this customer, press the **F16** key and repeat steps a and b.
3. If the customer wants to perform a different transaction, press the **F4** key to display the Transaction Menu.
4. If you have completed all transactions requested by this customer, press the **F2** key to display the Customer Verify Request screen in preparation for the next customer call.

Displaying Currently Scheduled Payments and Transfers

The following procedure enables you to display currently scheduled payments and transfers on behalf of the customer.

- Assumptions:
- The customer has been verified for the current call.
 - The scheduled payments and transfers have already been entered and have not yet been completed.
 - The customer is allowed to perform a scheduled transactions list inquiry transaction.

To display currently scheduled transactions, perform the following:

1. On any CSR screen, press the **F4** key to display the Transaction Menu, then select any scheduled transactions inquiry transaction (e.g., SCHEDULED TRANSACTIONS INQUIRY). The Scheduled Transactions screen is displayed.
2. On the Scheduled Transactions screen, use the QUERY fields and the **Shift-F7** and **Shift-F8** keys to peruse all scheduled payments and transfers for the customer. Scheduled payments are identified by a value of BLPY in the Tran Type field, while scheduled transfers are identified by a value of TRFR in this field. Recurring scheduled transactions also have values displayed in the Recur: Period and Recur: Remaining fields. Convey the displayed information for each scheduled transaction on which the customer wants to inquire. If the customer desires more detailed information for a particular transaction, perform the following steps:
 - a. Position the cursor next to the scheduled transaction entry and press the **F1** key. Either the Scheduled Payment Detail screen or the Scheduled Transfer Detail screen is displayed, depending on the type of scheduled transaction selected.
 - b. On the Scheduled Payment Detail screen or the Scheduled Transfer Detail screen, review the detailed transaction data and convey the requested information to the customer. Use the **F9** and **F11** keys to move between both screens of transaction detail as needed.
 - c. If you need to view detailed information for another scheduled transaction for this customer, press the **F16** key and repeat steps a and b.
3. If the customer wants to perform a different transaction, press the **F4** key to display the Transaction Menu.

4. If you have completed all transactions requested by this customer, press the **F2** key to display the Customer Verify Request screen in preparation for the next customer call.

Entering a User-Defined Transaction

The following procedure enables you to enter a user-defined transaction on behalf of the customer.

Assumptions: The customer has been verified for the current call.
All user-defined information required for the transaction has been configured.
The customer is allowed to perform the user-defined transaction.

To enter a user-defined transaction, perform the following:

1. From any CSR screen, press the **F4** key to display the Transaction Menu.
2. Select the user-defined transaction. The Transaction Selection screen is displayed.
3. On the Transaction Selection screen, select the account types on which the user-defined transaction is to be performed. The account type for account 1 is listed first, followed by the account type for account 2. Authorization Request screen 1 (transfer or user-defined) is displayed.
4. Optionally enter the amount of the user-defined transaction in whole and fractional currency units (e.g., U.S. dollars and cents) in the TRANSACTION AMOUNT field. A user-defined transaction may or may not require an amount, depending on whether it is a financial or nonfinancial transaction.
5. Optionally enter the account number or account qualifier of the first account in the ACCOUNT 1 NUMBER and ACCOUNT 1 QUALIFIER fields, if this is known. If you do not enter a value, the system will automatically select the account from the specified account type, or it will allow you to select an individual account from a list of all configured accounts with the same account number or account type when you authorize the transaction.
6. Optionally enter the account number or account qualifier of the second account in the ACCOUNT 2 NUMBER and ACCOUNT 2 QUALIFIER fields, if this is known. If you do not enter a value, the system will automatically select the account from the specified account type, or it will allow you to select an individual account from a list of all configured accounts with the same account number or account type when you authorize the transaction.

7. Press the **F5** key to authorize the transaction.
 - a. If the customer has two or more accounts of the account 1 number or account type specified and multiple account selection is not enabled, the system automatically selects which account to use based on an account selection hierarchy. If multiple account selection is enabled, the Account Selection screen is displayed. Select the individual account 1 on which the user-defined transaction is to be performed. The account 1 number and qualifier are returned and displayed in the ACCOUNT 1 NUMBER and ACCOUNT 1 QUALIFIER fields on Authorization Request screen 1 (transfer or user-defined).
 - b. If the customer has two or more accounts of the account 2 number or account type specified and multiple account selection is not enabled, the system automatically selects which account to use based on an account selection hierarchy. If multiple account selection is enabled, the Account Selection screen is displayed. Select the individual account 2 on which the user-defined transaction is to be performed. The account number and qualifier are returned and displayed in the ACCOUNT 2 NUMBER and ACCOUNT 2 QUALIFIER fields on Authorization Request screen 1 (transfer or user-defined).
8. Authorization Response screen 1 is displayed. This screen overlays the bottom half of the original Authorization Request screen. Check the Action Code field to determine whether the user-defined transaction was approved or denied. A value of 000 is displayed in the Action Code field if the user-defined transaction was approved. If you need to display an approved user-defined transaction at a later time, see the procedures for “Displaying Previous Transactions” provided elsewhere in this section.

A value other than 000 is displayed in the Action Code field if the user-defined transaction was denied. In this case, determine the appropriate action to take. Refer to the ***BASE24 Remote Banking Transaction Processing Manual*** for descriptions of all possible action codes.

If the user-defined transaction was approved, you can cancel the transaction by pressing the **F6** key. Press the **F6** key again to confirm the cancellation.
9. If the customer wants to perform another user-defined transaction, but using different accounts, press the **F7** key to change the account types. The Transaction Selection screen is displayed. Repeat steps 3 through 8 to complete the transaction.
10. If the customer wants to perform a different transaction, press the **F4** key to display the Transaction Menu.

11. If you have completed all transactions requested by this customer, press the **F2** key to display the Customer Verify Request screen in preparation for the next customer call.

Vendor Management

The following procedures allow you to manage the customer vendors for a BASE24-billpay customer:

- Listing all customer vendors available to the customer
- Requesting a Customer Vendor List to be printed for the customer
- Adding a customer vendor
- Activating or deactivating a customer vendor
- Updating customer vendor information

Listing Customer Vendors

The following procedure enables you to list all configured customer vendors available to a customer.

Assumptions:

- The customer has been verified for the current call.
- The customer's vendors have been configured and verified.
- The customer is allowed to perform any customer vendor transaction.

To display all configured customer vendors available to a customer, perform the following:

1. From any CSR screen, press the **F4** key to display the Transaction Menu. Select any customer vendor transaction (e.g., CUSTOMER VENDOR INQUIRY). The Customer Vendor Detail screen is displayed.
2. On the Customer Vendor Detail screen, you can either display detailed information for each customer vendor configured for the customer, or display a list of all customer vendors configured for the customer.
 - a. To display detailed information for each of the customer's vendors, use the QUERY fields and the **Shift-F7** and **Shift-F8** keys to move forward or backward through all configured customer vendors. As the detailed information for each customer vendor is displayed, convey the desired information to the customer.
 - b. To list all customer vendors available to the customer, press the **Shift-F5** keys to display the Customer Vendor List screen. Up to five customer vendors are displayed at a time on the screen. Use the QUERY fields and the **Shift-F7** and **Shift-F8** keys to move forward or backward through the list of customer vendors. As customer vendors are listed, convey the desired information to the customer.
3. If the customer wants to perform a different transaction, press the **F4** key to display the Transaction Menu.
4. If you have completed all transactions requested by this customer, press the **F2** key to display the Customer Verify Request screen in preparation for the next customer call.

Requesting a Customer Vendor List to be Printed

The following procedure enables you to request that a Customer Vendor List be printed and mailed to the customer. A Customer Vendor List should be printed and mailed to a customer after the customer vendors are initially added to the system and any time a change is made to a list of customer vendors. This procedure also enables you to request that a Customer Vendor List be printed when requested by a customer.

Note: This procedure only requests that a Customer Vendor List be printed. The list is actually printed at a later time during batch processing.

Assumptions:

- The customer has been verified for the current call.
- The customer's vendors have been configured and verified.
- The customer is allowed to perform a customer vendor request mailing transaction.

To request a Customer Vendor List to be printed for a customer, perform the following:

1. From any CSR screen, press the **F4** key to display the Transaction Menu. Select any customer vendor transaction (e.g., CUSTOMER VENDOR INQUIRY). The Customer Vendor Detail screen is displayed.
2. On the Customer Vendor Detail screen, press the **Shift-F9** keys to request the Customer Vendor List to be printed. A message is displayed indicating whether a request was successfully generated to print the list.
3. If the customer wants to perform a different transaction, press the **F4** key to display the Transaction Menu.
4. If you have completed all transactions requested by this customer, press the **F2** key to display the Customer Verify Request screen in preparation for the next customer call.

Adding a Customer Vendor

The following paragraphs provide procedures for adding a customer vendor. Two different procedures are used, depending upon whether or not the customer vendor to be added is already registered to the system. If your organization supports a closed vendor list, you can add customer vendors only for vendors who are already registered. In this case, follow the “Adding a Registered Vendor” procedure. If your organization supports an open vendor list, you can also add customer vendors for vendors who are not already registered. In this case, follow the “Adding an Unregistered Vendor” procedure. Your supervisor should be able to tell you whether your system uses an open or closed vendor list.

Adding a Registered Vendor

The following procedure adds a registered vendor on the Customer Vendor Detail screen. A registered vendor is one that already exists in the system and can be used by other customers. Registered vendors are displayed on the Vendor Registry screen.

Assumptions:

- The customer has been verified for the current call.
- The vendor has been verified and registered.
- The service provider uses a closed vendor list.
- You are allowed to perform a customer vendor add transaction on behalf of the customer.

To add a registered vendor, perform the following:

1. From any CSR screen, press the **F4** key to display the Transaction Menu. Select any customer vendor transaction (e.g., CUSTOMER VENDOR ADD). The Customer Vendor Detail screen is displayed.
2. On the Customer Vendor Detail screen, enter the vendor name in the Vendor Name field and press the **Shift-F4** keys to display the Vendor Registry screen. If you do not know the full name of the vendor, you can enter only a partial name.
3. When the Vendor Registry screen is displayed, all registered vendors with a vendor name equal to or greater than the name you entered are listed. You can scroll through this list using the **Shift-F7** and **Shift-F8** keys, the Name field, and the search flags, until you either find the registered vendor or determine that the vendor is not registered.

- If you find the vendor, you can display detailed vendor information by placing the cursor on the vendor entry and pressing the **F13** key. The Vendor Detail screen is displayed. When you are finished reviewing this information, press the **F16** key to return to the Vendor Registry screen.

When you have verified that you want to add the vendor, you can position the cursor by the vendor entry and press the **F1** key. This returns the vendor name to the Customer Vendor Detail screen.

After you select and return a vendor to the Customer Vendor Detail screen, vendor and vendor branch information will be displayed in many of the screen fields. You do not need to enter or change data in these fields.

- If you do not find the vendor (i.e., the vendor is not registered), you can try a different vendor name in the Name field. If you still cannot find the vendor, you cannot add the customer vendor. In this case, obtain the vendor information from the customer or refer them to another department or organization so that the appropriate back-office personnel can add and verify the vendor. Inform the customer that the customer vendor cannot be used until after the vendor is verified.

If the customer wants to perform a different transaction, press the **F4** key to display the Transaction Menu.

If you have completed all transactions requested by this customer, press the **F2** key to display the Customer Verify Request screen in preparation for the next customer call.

4. After you select and return a registered vendor to the Customer Vendor Detail screen, enter a customer vendor account number in the Account With Vendor field if a specific account exists with the vendor for this customer. You can check the customer account with vendor against the vendor masks defined for the vendor and vendor branch or view the vendor masks defined for the vendor and vendor branch. A value must be placed in the Account With Vendor field before the customer vendor can be added. If the customer does not have an account number with the vendor, the customer name is typically used as the account with vendor (e.g., JOHNQCUSTOMER).

Vendor masks are edit checks that ensure a customer account with vendor number is of the correct format, contains the correct number of digits, begins with a particular combination of digits, etc.

- To check the customer account with vendor against all edit checks defined for the vendor and vendor branch, enter the account value in the Account With Vendor field and press the **F13** key. The Customer Vendor Mask Verify screen is displayed. This screen displays a list of all applicable vendor masks and also indicates whether the entered account

value passed or failed each vendor mask edit check. If necessary, you can change the customer account with vendor and verify the new value by entering a value in the QUERY: Account With Vendor field and pressing the **Shift-F8** keys. The verification results are displayed on the screen. To return the last verified account value to the Customer Vendor Detail screen, press the **F13** key. To return to the Customer Vendor detail screen without changing the value in the Account With Vendor field, press the **F16** key.

- To view all edit checks defined for the vendor and vendor branch, leave the Account With Vendor field blank and press the **F13** key. All applicable vendor masks are displayed on the Customer Vendor Mask Verify screen.
 - When the Customer Vendor Mask Verify screen is displayed, you can view detailed vendor mask information for a particular mask by positioning the cursor on the entry and pressing the **F1** key. The Customer Vendor Mask Verify Detail screen is then displayed. Press the **F16** key to return to the Customer Vendor Mask Verify screen.
5. If the customer wants to use a vendor branch that is not already defined for the vendor, enter values in the Vendor Branch Name field and address fields (includes the Address, City, State, and Postal Code fields). The first line of address information is required while the second line is optional.
 6. Optionally, enter or change the value displayed in the Budget Category field. Any value you enter must already be defined to the system.
 7. Optionally enter values in the CustVend Short Name and User Info fields.
 8. Press the **F5** key to add the customer vendor.
 - When you add a customer vendor, it is assigned a customer vendor number that is one greater than the last customer vendor number used. This becomes the customer vendor number for the new row being added.
 - The vendor number for the vendor configured to the system is displayed to the right of the Vendor Name field value.
 - The Account With Vendor field value is validated against any account number masks if they exist at either the branch or vendor level in the system.
 - The Account With Vendor Status field is set to the initial value configured for the customer's financial institution. The account with vendor may need to be verified by back-office personnel before it can be used. If so, inform the customer that he or she cannot use the customer vendor until after it is verified.

- The Account: Begin Date field is set to the current date.
 - The Account: End Date field is set to blanks, indicating that the account with vendor does not expire.
9. If the customer vendor was added with an Account With Vendor Status field value of VERIFIED and the customer wants to make a payment to the customer vendor, press the **Shift-F1** keys to display the New Payment screen. Perform the procedure provided elsewhere in this section for “Entering a Payment.”
 10. If the customer wants to add more customer vendors, repeat steps 2 through 8 to add the next customer vendor.
 11. If the customer wants to perform a different transaction, press the **F4** key to display the Transaction Menu.
 12. If you have completed all transactions requested by this customer, press the **F2** key to display the Customer Verify Request screen in preparation for the next customer call.

Adding an Unregistered Vendor

The following procedure adds an unregistered vendor to the system. An unregistered vendor is a vendor that is not already defined on the Vendor Registry screen. To be sure that the vendor has not already been registered, the first three steps of this procedure are exactly the same as that for the “Adding a Registered Vendor” procedure. If the vendor is registered, you must use the registered vendor information. This ensures that duplicate vendors are not added under slightly different names.

Note: This procedure can only be used if the service provider supports an open vendor list.

- Assumptions:
- The customer has been verified for the current call.
 - The service provider uses an open vendor list.
 - You are allowed to perform a customer vendor add transaction on behalf of the customer.
 - You are allowed to add vendors on behalf of the system owner.

To add a registered vendor, perform the following:

1. From any CSR screen, press the **F4** key to display the Transaction Menu. Select any customer vendor transaction (e.g., CUSTOMER VENDOR ADD). The Customer Vendor Detail screen is displayed.
2. On the Customer Vendor Detail screen, enter the vendor name in the Vendor Name field and press the **Shift-F4** keys to display the Vendor Registry screen. If you do not know the full name of the vendor, you can enter only a partial name.
3. When the Vendor Registry screen is displayed, all registered vendors with a vendor name equal to or greater than the name you entered are listed. You can scroll through this list using the **Shift-F7** and **Shift-F8** keys, the Name field, and the search flags, until you either find the registered vendor or determine that the vendor is not registered.
 - If you find the vendor, you can select and return it to the Customer Vendor Detail screen by positioning the cursor on the vendor entry and pressing the **F1** key.

After you select and return a vendor to the Customer Vendor Detail screen, vendor and vendor branch information will be displayed in many of the screen fields. You do not need to enter or change data in these fields.

Add the customer vendor by completing steps 4 through 6 of the “Adding a Registered Vendor” procedure provided earlier in this section.

- If you determine that the vendor is not registered, you can try a different vendor name in the Name field. If you still cannot find the vendor, press the **F16** key to return to the Customer Vendor Detail screen and complete steps 4 through 6 to add the unregistered vendor.
4. On the Customer Vendor Detail screen, enter valid values in the following required fields. Refer to section 16 of this manual for detailed field descriptions.
- Vendor Name
 - Address (line 1)
 - City
 - ST
 - Postal Code
 - Account With Vendor (A value is required in this field, even if the customer does not have an actual account with the vendor. In this case, you might want to use the customer’s name as the account with vendor.)
- If one or more vendor masks exist for the account with vendor, the value must pass all vendor mask edits.
5. Optionally enter valid values in the following fields. Refer to section 16 of this manual for detailed field descriptions.
- Vendor Branch Name
 - Address (line 2)
 - Phone
 - Budget Category
- If you want to use the budget category provided in the default Vendor Table row, leave this field blank. If you enter a budget category, it must already be defined to the system.
- CustVend Short Name
 - User Info (2 fields)

6. Press the **F5** key to add the customer vendor.
 - The customer vendor is added with the following information:
 - One is added to the last customer vendor number used. This becomes the customer vendor number for the new row being added.
 - A system-assigned vendor number is displayed for the vendor to the right of the Vendor Name field value.
 - The Account With Vendor Status field is set to the initial value defined for the customer's financial institution. The account with vendor may need to be verified by service provider or financial institution back-office personnel before it can be used. If so, inform the customer that he or she cannot use the customer vendor until after it is verified.
 - The Account: Begin Date field is set to the current date.
 - The Account: End Date field is set to all blanks, indicating that the account with vendor does not expire.
 - A new row for the vendor is created in the Vendor Table. Default data from the default Vendor Table row for the system is applied to several fields in this row.
 - A new row for the vendor branch is created in the Vendor Branch Table.
 - A new row for the vendor's remittance branch is created in the Vendor Branch Table if it is different from the vendor's main branch in the Vendor Table.

If the customer vendor was added with an Account With Vendor Status field value of VERIFIED and the customer wants to make a payment to the customer vendor, press the **Shift-F1** keys to display the New Payment screen. Perform the procedure provided elsewhere in this section for "Entering a Payment."

7. If the customer wants to add more customer vendors, repeat steps 1 through 6 to add the next customer vendor.
8. If the customer wants to perform a different transaction, press the **F4** key to display the Transaction Menu.
9. If you have completed all transactions requested by this customer, press the **F2** key to display the Customer Verify Request screen in preparation for the next customer call.

Activating or Deactivating Customer Vendors

The following procedure enables you to activate, reactivate, or deactivate a customer vendor. A customer vendor must be activated before it can be used for payment transactions.

If a customer vendor is no longer needed by a customer, you can deactivate the customer vendor as long as there are no pending scheduled payments from the customer to the customer vendor. Any pending scheduled payments to a customer vendor must be deleted prior to deactivating the customer vendor. See the procedure for “Deleting Scheduled Payment Transactions” provided elsewhere in this section for details on how to delete pending scheduled payments.

If the customer has multiple accounts with the same vendor, deactivating a customer vendor only deactivates a particular customer account with vendor relationship represented by that customer vendor. It does not deactivate any other account relationships the customer may have with the same vendor. Each customer vendor defining a customer account with vendor relationship must be deactivated separately.

Note: Deactivated customer vendors are retained in the Customer Vendor Table until sometime after the Customer Vendor Year End Summary is generated for the customer. You can use the activate function to reactivate a customer vendor that has been deactivated as long as it still exists in the Customer Vendor Table.

Assumptions:

- The customer has been verified for the current call.
- The customer’s vendor has been configured and verified.
- For deactivation, no scheduled payments are currently pending for the customer vendor.
- You are allowed to perform a customer vendor activate or customer vendor deactivate transaction on behalf of the customer.

To activate, reactivate, or deactivate a customer vendor, perform the following:

1. From any CSR screen, press the **F4** key to display the Transaction Menu. Select any customer vendor transaction (e.g., CUSTOMER VENDOR ACTIVATE). The Customer Vendor Detail screen is displayed.
2. Use the QUERY fields and the **Shift-F7** and **Shift-F8** keys until you find the customer vendor to activate or deactivate.

- To activate or reactivate a customer vendor, press the **F15** key while the customer vendor is displayed.

Activating a customer vendor changes the value of the Status field from an I (initial) to a value of V (verified), sets the Begin Date field to the current date, and sets the End Date field to a nonexpiring value.
Reactivating a customer vendor changes the date fields only.
 - To deactivate a customer vendor, press the **F6** key while the customer vendor is displayed. Press the **F6** key again to confirm the deactivation.

Deactivating a customer vendor causes the Account: End Date field for the row to be set to a value of one less than the current date.
3. If the customer wants to activate, reactivate, or deactivate more customer vendors, repeat steps 2 through 3 to deactivate the next customer vendor.
 4. If the customer wants to perform a different transaction, press the **F4** key to display the Transaction Menu.
 5. If you have completed all transactions requested by this customer, press the **F2** key to display the Customer Verify Request screen in preparation for the next customer call.

Updating Customer Vendor Information

After a customer vendor has been added to the system, you can update certain vendor information depending upon the current verification status of the vendor, the type of vendor, and the current status of the customer's account with the vendor, as shown in the following table.

The first column of the table indicates the verification status displayed for the vendor on the Vendor Registry screen. The second column indicates the vendor type displayed for the vendor on the Vendor Registry screen. The third column indicates the values displayed in the Account With Vendor Status field on the Customer Vendor Detail screen for the customer's account with the vendor. The fourth column indicates the fields that can be updated on the Customer Vendor Detail screen for each combination of values in the first three columns. The fifth column indicates the fields that can be updated in the Vendor Registry for each combination of values in the first three columns.

Vendor Registry Fields		Customer Vendor Detail Fields		Vendor Registry Fields Updated
Verfd	Type	Account With Vendor Status	Fields You Can Update:

INITIAL	LIMITED	VERIFIED	All fields	All fields
Not INITIAL or VERIFIED	PUBLIC or LIMITED	Not INITIAL or VERIFIED	None	None

Assumptions: The customer has been verified for the current call.
 The customer's vendor has been configured.
 You are allowed to perform a customer vendor update transaction on behalf of the customer.

To update a customer vendor, perform the following:

1. From any CSR screen, press the **F4** key to display the Transaction Menu. Select any customer vendor transaction (e.g., CUSTOMER VENDOR UPDATE). The Customer Vendor Detail screen is displayed.
2. Use the QUERY fields and the **Shift-F7** and **Shift-F8** keys, until you find the customer vendor the customer wants to update.
3. Change the values of all desired fields on screen 1 and press the **F8** key. If a field cannot be updated, an appropriate error message will be displayed. In this case, the field can only be changed by back-office personnel using the Customer Vendor Table (CVND) table maintenance screen. Take action appropriate to the policies of your organization.
4. If the customer wants to update more customer vendors, press the **F1** key to clear the screen and repeat steps 2 and 3 to update the next customer vendor.
5. If the customer wants to perform a different transaction, press the **F4** key to display the Transaction Menu.
6. If you have completed all transactions requested by this customer, press the **F2** key to display the Customer Verify Request screen in preparation for the next customer call.

Displaying Previous Transactions

The following procedures allow you to display previous transactions performed by the customer or on behalf of the customer. Procedures for the following functions are included:

- Determining whether a particular check has cleared
- Displaying transactions that debited a customer account
- Displaying transactions that credited a customer account
- Displaying transactions that debited or credited a customer account during a specified time period
- Displaying transactions involving a check
- Displaying transactions that originated from a particular source
- Displaying unscheduled transfers
- Displaying completed payments and transfers
- Displaying BASE24-billpay transaction history
- Displaying statement and statement closing information

Determining Whether a Check has Cleared

The following procedure enables you to determine whether a specific check for a particular customer account has cleared.

Assumptions: The customer has been verified for the current call.
 The customer is allowed to perform check clearance inquiry transactions.

To determine whether a customer check has cleared, perform the following:

1. From any CSR screen, press the **F4** key to display the Transaction Menu.
2. Select the CHECK CLEARANCE INQUIRY transaction. The Transaction Selection screen is displayed.
3. On the Transaction Selection screen, select the account type on which the check clearance inquiry transaction is to be performed (e.g., CHECK CLEARANCE DDA). Authorization Request screen 1 (check clearance inquiry) is displayed.
4. Optionally enter the account number or account qualifier of the account to be inquired upon in the ACCOUNT 1 NUMBER and ACCOUNT 1 QUALIFIER fields, if this is known. If you do not enter a value, the system will automatically select the account from the account type specified or allow you to select an individual account from a list of all configured accounts of the specified type when you authorize the transaction.
5. Enter the number of the check in the CHEQUE NUMBER field.
6. Optionally enter the amount of the check in whole and fractional currency units (e.g., U.S. dollars and cents) in the TRANSACTION AMOUNT field. This amount enables you to refine the search for a check of the specified amount.
7. Press the **F5** key to authorize the transaction. If the customer has two or more accounts of the account number or account type specified and multiple account selection is not enabled, the system automatically selects which account to use based on an account selection hierarchy. If multiple account selection is enabled, the Account Selection screen is displayed. Select the individual account on which the check clearance inquiry transaction is to be performed. The account number and qualifier are returned and displayed in the ACCOUNT 1 NUMBER and ACCOUNT 1 QUALIFIER fields on Authorization Request screen 1 (check clearance inquiry).

- If the check clearance inquiry transaction is approved, Last Transactions Response screen 1 is displayed. This screen overlays the bottom half of the original Authorization Request screen.

The specific check transaction information is displayed near the bottom of the screen. If the check has not yet cleared, no check transaction will be displayed. If the check has cleared, one or more check transactions that met the search criteria will be displayed.

If you want to search for additional cleared check transactions, press the **F9** key. Currently, the only way to tell when no additional cleared check transactions are available is if no additional transactions are displayed when you press the **F9** key. Continue to press the **F9** key until no additional transactions are displayed.

If the customer's financial institution allows nonfinancial transactions to be canceled, you can cancel the check clearance inquiry transaction by pressing the **F6** key. Press the **F6** key again to confirm the cancellation.

- If the check clearance inquiry transaction is denied, Authorization Response screen 1 is displayed. This screen overlays the bottom half of the original Authorization Request screen.

Check the value in the Action Code field to determine the reason the transaction was denied and take the appropriate action. Refer to the ***BASE24 Remote Banking Transaction Processing Manual*** for detailed descriptions of all possible action codes.

8. If the customer wants to perform another check clearance inquiry transaction using a different account, check number, or amount, press the **F7** key to redisplay the Transaction Selection screen, and repeat steps 3 through 7.
9. If the customer wants to perform a different transaction, press the **F4** key to display the Transaction Menu.
10. If you have completed all transactions requested by this customer, press the **F2** key to display the Customer Verify Request screen in preparation for the next customer call.

Displaying Debit Transactions

The following procedure enables you to display the last debit transactions performed on a specified customer account.

Assumptions: The customer has been verified for the current call.
 The customer is allowed to perform a last count of debit transactions inquiry transaction.

To display the last debit transactions for an account, perform the following:

1. From any CSR screen, press the **F4** key to display the Transaction Menu.
2. Select the LAST COUNT DEBIT INQUIRY transaction. The Transaction Selection screen is displayed.
3. On the Transaction Selection screen, select the account type on which the last debit inquiry transaction is to be performed (e.g., LAST COUNT DEBIT DDA). Authorization Request screen 1 (one-sided, set 2) is displayed.
4. Optionally enter the account number or account qualifier of the account to be inquired upon in the ACCOUNT 1 NUMBER and ACCOUNT 1 QUALIFIER fields, if this is known. If you do not enter a value, the system will automatically select the account from the account type specified or allow you to select an individual account from a list of all configured accounts of the specified type when you authorize the transaction.
5. Optionally enter the amount of the debit transactions to be inquired upon in whole and fractional currency units (e.g., U.S. dollars and cents) in the TRANSACTION AMOUNT field. This amount enables you to refine the search for debit transactions to only those of a specified amount.
6. Press the **F5** key to authorize the transaction. If the customer has two or more accounts of the account number or account type specified and multiple account selection is not enabled, the system automatically selects which account to use based on an account selection hierarchy. If multiple account selection is enabled, the Account Selection screen is displayed. Select the individual account on which the last debit inquiry transaction is to be performed. The account number and qualifier are returned and displayed in the ACCOUNT 1 NUMBER and ACCOUNT 1 QUALIFIER fields on Authorization Request screen 1 (one-sided, set 2).
 - If the last count of debit transactions inquiry transaction is approved, Last Transactions Response screen 1 is displayed. This screen overlays the bottom half of the original Authorization Request screen. Up to five debit transactions are displayed near the bottom of the screen.

If you want to search for additional debit transactions, press the **F9** key. Currently, the only way to tell when no additional debit transactions are available is if no additional transactions are displayed when you press the **F9** key. Continue to press the **F9** key until no additional transactions are displayed.

If the customer's financial institution allows nonfinancial transactions to be canceled, you can cancel the last debit inquiry transaction by pressing the **F6** key. Press the **F6** key again to confirm the cancellation.

- If the last count of debit transactions inquiry transaction is denied, Authorization Response screen 1 is displayed. This screen overlays the bottom half of the original Authorization Request screen.

Check the value in the Action Code field to determine the reason the transaction was denied and take the appropriate action. Refer to the ***BASE24 Remote Banking Transaction Processing Manual*** for descriptions of all possible action codes.

7. If the customer wants to perform another last count of debit transactions inquiry transaction using a different account, press the **F7** key to change the account type. The Transaction Selection screen is displayed. Repeat steps 3 through 6 to complete the transaction.
8. If the customer wants to perform a different transaction, press the **F4** key to display the Transaction Menu.
9. If you have completed all transactions requested by this customer, press the **F2** key to display the Customer Verify Request screen in preparation for the next customer call.

Displaying Credit Transactions

The following procedure enables you to display the last credit transactions performed on a specified customer account.

Assumptions: The customer has been verified for the current call.
 The customer is allowed to perform a last count of credit transactions inquiry transaction.

To display the last credit transactions for an account, perform the following:

1. From any CSR screen, press the **F4** key to display the Transaction Menu.
2. Select the LAST COUNT CREDIT INQUIRY transaction. The Transaction Selection screen is displayed.
3. On the Transaction Selection screen, select the account type on which the last count of credit transactions inquiry transaction is to be performed (e.g., LAST COUNT CREDIT SAV). Authorization Request screen 1 (one-sided, set 2) is displayed.
4. Optionally enter the account number or account qualifier of the account to be inquired upon in the ACCOUNT 1 NUMBER and ACCOUNT 1 QUALIFIER fields, if this is known. If you do not enter a value, the system will automatically select the account from the account type specified or allow you to select an individual account from a list of all configured accounts of the specified type when you authorize the transaction.
5. Optionally enter the amount of the credit transactions to be inquired upon in whole and fractional currency units (e.g., U.S. dollars and cents) in the TRANSACTION AMOUNT field. This amount enables you to refine the search for credit transactions to only those of a specified amount.
6. Press the **F5** key to authorize the transaction. If the customer has two or more accounts of the account number or account type specified and multiple account selection is not enabled, the system automatically selects which account to use based on an account selection hierarchy. If multiple account selection is enabled, the Account Selection screen is displayed. Select the individual account on which the last credit inquiry transaction is to be performed. The account number and qualifier are returned and displayed in the ACCOUNT 1 NUMBER and ACCOUNT 1 QUALIFIER fields on Authorization Request screen 1 (one-sided, set 2).

- If the last count of credit transactions inquiry transaction is approved, Last Transactions Response screen 1 is displayed. This screen overlays the bottom half of the original Authorization Request screen. Up to five credit transactions are displayed near the bottom of the screen.

If you want to search for additional credit transactions, press the **F9** key. Currently, the only way to tell when no additional credit transactions are available is if no additional transactions are displayed when you press the **F9** key. Continue to press the **F9** key until no additional transactions are displayed.

If the customer's financial institution allows nonfinancial transactions to be canceled, you can cancel the last credit inquiry transaction by pressing the **F6** key. Press the **F6** key again to confirm the cancellation.

- If the last count of credit transactions inquiry transaction is denied, Authorization Response screen 1 is displayed. This screen overlays the bottom half of the original Authorization Request screen.

Check the value in the Action Code field to determine the reason the transaction was denied and take the appropriate action. Refer to the ***BASE24 Remote Banking Transaction Processing Manual*** for descriptions of all possible action codes.

7. If the customer wants to perform another last count of credit transactions inquiry transaction using a different account, press the **F7** key to change the account type. The Transaction Selection screen is displayed. Repeat steps 3 through 6 to complete the transaction.
8. If the customer wants to perform a different transaction, press the **F4** key to display the Transaction Menu.
9. If you have completed all transactions requested by this customer, press the **F2** key to display the Customer Verify Request screen in preparation for the next customer call.

Displaying Debit and Credit Transactions

The following procedure enables you to display the last debit and credit transactions performed on a specified customer account for a specific time period.

Assumptions: The customer has been verified for the current call.
 The customer is allowed to perform a last count of debit/credit transactions inquiry transaction.

To display the last debit and credit inquiry transactions for an account, perform the following:

1. From any CSR screen, press the **F4** key to display the Transaction Menu.
2. Select the LAST COUNT DB/CR INQUIRY transaction. The Transaction Selection screen is displayed.
3. On the Transaction Selection screen, select the account type on which the last count of debit/credit transactions inquiry transaction is to be performed (e.g., LAST COUNT DB/CR SAV). Authorization Request screen 1 (one-sided, set 3) is displayed.
4. Optionally enter the account number or account qualifier of the account to be inquired upon in the ACCOUNT 1 NUMBER and ACCOUNT 1 QUALIFIER fields, if this is known. If you do not enter a value, the system will automatically select the account from the account type specified or allow you to select an individual account from a list of all configured accounts of the specified type when you authorize the transaction.
5. Optionally enter the dates for which debit and credit transactions are to be reported in the START DATE and END DATE fields. Values in these fields allow you to refine the search for debit and credit transactions for a specific time period.
6. Press the **F5** key to authorize the transaction. If the customer has two or more accounts of the account number or account type specified and multiple account selection is not enabled, the system automatically selects which account to use based on an account selection hierarchy. If multiple account selection is enabled, the Account Selection screen is displayed. Select the individual account on which the last debit/credit inquiry transaction is to be performed. The account number and qualifier are returned and displayed in the ACCOUNT 1 NUMBER and ACCOUNT 1 QUALIFIER fields on Authorization Request screen 1 (one-sided, set 3).

- If the last count of debit/credit transactions inquiry transaction is approved, Last Transactions Response screen 1 is displayed. This screen overlays the bottom half of the original Authorization Request screen. Up to five debit and credit transactions are displayed near the bottom of the screen.

If you want to search for additional debit and credit transactions, press the **F9** key. Currently, the only way to tell when no additional debit and credit transactions are available is if no additional transactions are displayed when you press the **F9** key. Continue to press the **F9** key until no additional transactions are displayed.

If the customer's financial institution allows nonfinancial transactions to be canceled, you can cancel the last debit/credit inquiry transaction by pressing the **F6** key. Press the **F6** key again to confirm the cancellation.

- If the last count of debit/credit transactions inquiry transaction is denied, Authorization Response screen 1 is displayed. This screen overlays the bottom half of the original Authorization Request screen.

Check the value in the Action Code field to determine the reason the transaction was denied and take the appropriate action. Refer to the ***BASE24 Remote Banking Transaction Processing Manual*** for descriptions of all possible action codes.

7. If the customer wants to perform another last count of debit/credit transactions inquiry transaction using a different account or different start and end dates, press the **F7** key to redisplay the Transaction Selection screen. Repeat steps 3 through 6 to complete the transaction.
8. If the customer wants to perform a different transaction, press the **F4** key to display the Transaction Menu.
9. If you have completed all transactions requested by this customer, press the **F2** key to display the Customer Verify Request screen in preparation for the next customer call.

Displaying Account Check Transactions

The following procedure enables you to display the last check transactions performed on a specified customer account.

Assumptions: The customer has been verified for the current call.
 The customer is allowed to perform a last count of check transactions inquiry transaction.

To display the last check transactions for an account, perform the following:

1. From any CSR screen, press the **F4** key to display the Transaction Menu.
2. Select the LAST COUNT CHECK INQUIRY transaction. The Transaction Selection screen is displayed.
3. On the Transaction Selection screen, select the account type on which the last count of check transactions inquiry transaction is to be performed (e.g., LAST COUNT CHECK NOW). Authorization Request screen 1 (one-sided, set 2) is displayed.
4. Optionally enter the account number or account qualifier of the account to be inquired upon in the ACCOUNT 1 NUMBER and ACCOUNT 1 QUALIFIER fields, if this is known. If you do not enter a value, the system will automatically select the account from the account type specified or allow you to select an individual account from a list of all configured accounts of the specified type when you authorize the transaction.
5. Optionally enter the amount of the check transactions to be inquired upon in whole and fractional currency units (e.g., U.S. dollars and cents) in the TRANSACTION AMOUNT field. This amount enables you to refine the search for check transactions to only those of a specified amount.
6. Press the **F5** key to authorize the transaction. If the customer has two or more accounts of the account number or account type specified and multiple account selection is not enabled, the system automatically selects which account to use based on an account selection hierarchy. If multiple account selection is enabled, the Account Selection screen is displayed. Select the individual account on which the last check inquiry transaction is to be performed. The account number and qualifier are returned and displayed in the ACCOUNT 1 NUMBER and ACCOUNT 1 QUALIFIER fields on Authorization Request screen 1 (one-sided, set 2).

- If the last count of check transactions inquiry transaction is approved, Last Transactions Response screen 1 is displayed. This screen overlays the bottom half of the original Authorization Request screen. Up to five check transactions are displayed near the bottom of the screen.

If you want to search for additional check transactions, press the **F9** key. Currently, the only way to tell when no additional check transactions are available is if no additional transactions are displayed when you press the **F9** key. Continue to press the **F9** key until no additional transactions are displayed.

If the customer's financial institution allows nonfinancial transactions to be canceled, you can cancel the last check inquiry transaction by pressing the **F6** key. Press the **F6** key again to confirm the cancellation.

- If the last count of check transactions inquiry transaction is denied, Authorization Response screen 1 is displayed. This screen overlays the bottom half of the original Authorization Request screen.

Check the value in the Action Code field to determine the reason the transaction was denied and take the appropriate action. Refer to the ***BASE24 Remote Banking Transaction Processing Manual*** for descriptions of all possible action codes.

7. If the customer wants to perform another last count of check transactions inquiry transaction using a different account, press the **F7** key to change the account type. The Transaction Selection screen is displayed. Repeat steps 3 through 6 to complete the transaction.
8. If the customer wants to perform a different transaction, press the **F4** key to display the Transaction Menu.
9. If you have completed all transactions requested by this customer, press the **F2** key to display the Customer Verify Request screen in preparation for the next customer call.

Displaying Transactions By Source

The following procedure enables you to display the last transactions performed on a specified customer account at a specified source (e.g., a remote banking device).

Assumptions: The customer has been verified for the current call.
 The customer is allowed to perform a last count of account by source transactions inquiry transaction.

To display the last transactions by source for an account, perform the following:

1. From any CSR screen, press the **F4** key to display the Transaction Menu.
2. Select the LAST COUNT SOURCE INQUIRY transaction. The Transaction Selection screen is displayed.
3. On the Transaction Selection screen, select the account type on which the last count of account by source transactions inquiry transaction is to be performed (e.g., LAST COUNT SOURCE SAV). Authorization Request screen 1 (last source inquiry) is displayed.
4. Optionally enter the account number or account qualifier of the account to be inquired upon in the ACCOUNT 1 NUMBER and ACCOUNT 1 QUALIFIER fields, if this is known. If you do not enter a value, the system will automatically select the account from the account type specified or allow you to select an individual account from a list of all configured accounts of the specified type when you authorize the transaction.
5. Enter a code identifying the source of transactions to be inquired upon in the SOURCE CODE field. Refer to section 7 for valid values.
6. Press the **F5** key to authorize the transaction. If the customer has two or more accounts of the account number or account type specified and multiple account selection is not enabled, the system automatically selects which account to use based on an account selection hierarchy. If multiple account selection is enabled, the Account Selection screen is displayed. Select the individual account on which the last source inquiry transaction is to be performed. The account number and qualifier are returned and displayed in the ACCOUNT 1 NUMBER and ACCOUNT 1 QUALIFIER fields on Authorization Request screen 1 (last source inquiry).
 - If the last count of account by source transactions inquiry transaction is approved, Last Transactions Response screen 1 is displayed. This screen overlays the bottom half of the original Authorization Request screen. Up to five transactions entered at the specified source are displayed near the bottom of the screen.

If you want to search for additional transactions for the specified source, press the **F9** key. Currently, the only way to tell when no additional transactions are available for the specified source is if no additional transactions are displayed when you press the **F9** key. Continue to press the **F9** key until no additional transactions are displayed.

If the customer's financial institution allows nonfinancial transactions to be canceled, you can cancel the last source inquiry transaction by pressing the **F6** key. Press the **F6** key again to confirm the cancellation.

- If the last count of account by source transactions inquiry transaction is denied, Authorization Response screen 1 is displayed. This screen overlays the bottom half of the original Authorization Request screen.

Check the value in the Action Code field to determine the reason the transaction was denied and take the appropriate action. Refer to the ***BASE24 Remote Banking Transaction Processing Manual*** for descriptions of all possible action codes.

7. If the customer wants to perform another last count of account by source transactions inquiry transaction using a different account or a different source, press the **F7** key to redisplay the Transaction Selection screen. Repeat steps 3 through 6 to complete the transaction.
8. If the customer wants to perform a different transaction, press the **F4** key to display the Transaction Menu.
9. If you have completed all transactions requested by this customer, press the **F2** key to display the Customer Verify Request screen in preparation for the next customer call.

Displaying Unscheduled Transfer Transactions

The following procedure enables you to display the last unscheduled transfer transactions performed on a specified customer account. The account can be a *from* account or a *to* account in the transfers reported.

To display scheduled transfer transactions, see the procedures for “Displaying Currently Scheduled Transactions” or “Displaying Completed Payments and Transfers” provided elsewhere in this section.

Assumptions: The customer has been verified for the current call.
 The customer is allowed to perform a last count of account transfer transactions inquiry transaction.

To display the last transfer transactions for an account, perform the following:

1. From any CSR screen, press the **F4** key to display the Transaction Menu.
2. Select the LAST COUNT TRANSFER INQUIRY transaction. The Transaction Selection screen is displayed.
3. On the Transaction Selection screen, select the account type on which the last count of account transfer transactions inquiry transaction is to be performed (e.g., LAST COUNT TRANSFER SAV). Authorization Request screen 1 (one-sided, set 1) is displayed.
4. Optionally enter the account number or account qualifier of the account to be inquired upon in the ACCOUNT 1 NUMBER and ACCOUNT 1 QUALIFIER fields, if this is known. If you do not enter a value, the system will automatically select the account from the account type specified or allow you to select an individual account from a list of all configured accounts of the specified type when you authorize the transaction.
5. Press the **F5** key to authorize the transaction. If the customer has two or more accounts of the account number or account type specified and multiple account selection is not enabled, the system automatically selects which account to use based on an account selection hierarchy. If multiple account selection is enabled, the Account Selection screen is displayed. Select the individual account on which the last transfer inquiry transaction is to be performed. The account number and qualifier are returned and displayed in the ACCOUNT 1 NUMBER and ACCOUNT 1 QUALIFIER fields on Authorization Request screen 1 (one-sided, set 1).

- If the last count of account transfer transactions inquiry transaction is approved, Last Transactions Response screen 1 is displayed. This screen overlays the bottom half of the original Authorization Request screen. Up to five transfer transactions are displayed near the bottom of the screen.

If you want to search for additional transfer transactions, press the **F9** key. Currently, the only way to tell when no additional transfer transactions are available is if no additional transactions are displayed when you press the **F9** key. Continue to press the **F9** key until no additional transactions are displayed.

If the customer's financial institution allows nonfinancial transactions to be canceled, you can cancel the last transfer inquiry transaction by pressing the **F6** key. Press the **F6** key again to confirm the cancellation.

- If the last count of account transfer transactions inquiry transaction is denied, Authorization Response screen 1 is displayed. This screen overlays the bottom half of the original Authorization Request screen.

Check the value in the Action Code field to determine the reason the transaction was denied and take the appropriate action. Refer to the ***BASE24 Remote Banking Transaction Processing Manual*** for descriptions of all possible action codes.

6. If the customer wants to perform another last count of account transfer transactions inquiry transaction using a different account, press the **F7** key to change the account type. The Transaction Selection screen is displayed. Repeat steps 3 through 5 to complete the transaction.
7. If the customer wants to perform a different transaction, press the **F4** key to display the Transaction Menu.
8. If you have completed all transactions requested by this customer, press the **F2** key to display the Customer Verify Request screen in preparation for the next customer call.

Displaying Completed Payments and Transfers

The following procedure enables you to display payment and transfer transactions that were once scheduled and are now considered to be complete.

- Assumptions:
- The customer has been verified for the current call.
 - The transactions to be inquired upon have not yet been archived.
 - You are allowed to perform a history inquiry – payments and transfers transaction on behalf of the customer.

To display completed payments and transfers, perform the following:

1. Access the Transaction History screen, as follows:
 - On any CSR screen, press the **F4** key to display the Transaction Menu, then select the HISTORY INQUIRY – PMNTS/XFERS or HISTORY INQUIRY – ALL TRANS transaction.
 - On the New Payment, New Transfer, or Customer Information screens, press the **Shift-F6** keys.

In either case, the Transaction History screen is displayed.
2. On the Transaction History screen, use the QUERY fields and the **Shift-F7** and **Shift-F8** keys to peruse the BASE24-billpay transactions performed on behalf of or by the customer. You can use the QUERY: Mode field to filter the transactions displayed. A value of F-APRV in this field displays all approved financial transactions, a value of F-DENY, displays all denied financial transactions, and a value of F-BOTH displays both approved and denied financial transactions. A value of A-APRV in this field displays all approved transactions, a value of A-DENY, displays only denied transactions, and a value of A-BOTH displays both approved and denied transactions. Convey the displayed information for each transaction on which the customer wants to inquire. If the customer desires more detailed information for a particular transaction, perform the following steps:
 - a. Position the cursor next to the transaction entry for which additional information is desired and press the **F1** key. The Transaction History Detail screen is displayed.
 - b. On the Transaction History Detail screen, review the detailed transaction data and convey the requested information to the customer. Use the **F9** and **F11** keys to move between both screens of transaction history detail as needed.

- c. If you need to view detailed information for another completed payment or transfer for this customer, press the **F16** key and repeat steps a and b.
3. If the customer wants to perform a different transaction, press the **F4** key to display the Transaction Menu.
4. If you have completed all transactions requested by this customer, press the **F2** key to display the Customer Verify Request screen in preparation for the next customer call.

Displaying BASE24-billpay Transaction History

The following procedure enables you to display all transactions (both financial and nonfinancial) recorded in the History Table (HIST). All Enhanced Telebanking and BASE24-billpay transaction activity is recorded in this table.

Assumptions:

- The customer has been verified for the current call.
- The transactions to be inquired upon have not yet been archived.
- You are allowed to perform a history inquiry – all transactions transaction on behalf of the customer.

To display BASE24-billpay transaction history, perform the following:

1. Access the Transaction History screen, as follows:
 - On any CSR screen, press the **F4** key to display the Transaction Menu, then select the HISTORY INQUIRY – ALL TRANS or HISTORY INQUIRY – PMNTS/XFERS transaction.
 - On the New Payment, New Transfer, or Customer Information screens, press the **Shift-F6** keys.

In either case, the Transaction History screen is displayed.
2. On the Transaction History screen, use the QUERY fields and the **Shift-F7** and **Shift-F8** keys to peruse the BASE24-billpay transactions performed on behalf of or by the customer. You can use the QUERY: Mode field to filter the transactions displayed. A value of A-APRV in this field displays all approved transactions, a value of A-DENY, displays only denied transactions, and a value of A-BOTH displays both approved and denied transactions. A value of F-APRV in this field displays all approved financial transactions, a value of F-DENY, displays all denied financial transactions, and a value of F-BOTH displays both approved and denied financial transactions. Convey the displayed information for each transaction on which the customer wants to inquire. If the customer desires more detailed information for a particular transaction, perform the following steps:
 - a. Position the cursor next to the transaction entry for which additional information is desired and press the **F1** key. The Transaction History Detail screen is displayed.
 - b. On the Transaction History Detail screen, review the detailed transaction data and convey the requested information to the customer. Use the **F9** and **F11** keys to move between both screens of transaction history detail as needed.

- c. If you need to view detailed information for another transaction for this customer, press the **F16** key and repeat steps a and b.
3. If the customer wants to perform a different transaction, press the **F4** key to display the Transaction Menu.
4. If you have completed all transactions requested by this customer, press the **F2** key to display the Customer Verify Request screen in preparation for the next customer call.

Displaying Statement Closing Information

The following procedures enable you to enter a statement closing download request on behalf of a customer.

Assumptions: The customer has been verified for the current call.
 The customer is allowed to perform a statement closing download transaction

To enter a statement closing download request, perform the following:

1. From any CSR screen, press the **F4** key to display the Transaction Menu.
2. Select the statement closing download request transaction (e.g., STMT CLOSING DOWNLOAD INQ). The Transaction Selection screen is displayed.
3. On the Transaction Selection screen, select the account type on which the statement closing download transaction is to be performed (e.g., STATEMENT CLOSING DWNLD SAV). Authorization Request screen 1 in the one-sided, set 3 format is displayed.
4. Optionally enter the account number or account qualifier of the account for which a closing statement is requested, if this is known, in the ACCOUNT 1 NUMBER and ACCOUNT 1 QUALIFIER fields. If you do not enter a value, the system automatically selects the account from the account type specified, or it allows you to select an individual account from a list of all configured accounts of the specified type when you authorize the transaction.
5. Optionally enter a start date and an end date in the START DATE and END DATE fields. If you do not enter a start date, transactions are returned starting with the first available transaction is returned. If you do not enter an end date, transactions are returned ending with the last available transaction. Note that if you enter an end date, you also must enter a start date.

6. Press the **F5** key to authorize the transaction. If the customer has two or more accounts of the account number or account type specified and multiple account selection is not enabled, the system automatically selects which account to use based on an account selection hierarchy. If multiple account selection is enabled, the Account Selection screen is displayed. Select the individual account on which the statement closing download transaction is to be performed.
7. The Statement Closing Download Response screen is displayed. Convey this information to the customer. The message MORE INFORMATION AVAILABLE is displayed if more transactions were returned from the host. Press the **F9** key to view more transactions. When all transactions have been returned, the message NO MORE INFORMATION AVAILABLE is displayed.
8. If the customer wants to perform a different transaction, press the **F4** key to display the Transaction Menu.
9. If you have completed all transactions requested by this customer, press the **F2** key to display the Customer Verify Request screen in preparation for the next customer call.

Displaying Statement Information

The following procedures enables you to enter a statement download request on behalf of the customer.

Assumptions: The customer has been verified for the current call.
 The customer is allowed to perform a statement download transaction.

To enter a statement download request, perform the following:

1. From any CSR screen, press the **F4** key to display the Transaction Menu.
2. Select the statement download inquiry transaction (e.g., STMT DOWNLOAD INQ), and press the **F1** key. The Transaction Selection screen is displayed.
3. On the Transaction Selection screen, select the account type on which the statement download is to be performed (e.g., STATEMENT DOWNLOAD DDA). The Authorization Request screen in the one-sided, set 3 format is displayed.

4. Optionally enter the account number or account qualifier of the account for which a statement is requested, if this is known, in the ACCOUNT 1 NUMBER and ACCOUNT 1 QUALIFIER fields. If you do not enter a value, the system automatically selects the account from the account type specified or allow you to select an individual account from a list of all configured accounts of the specified type when you authorize the transaction.
5. Optionally enter a start date and an end date in the START DATE and END DATE fields. If you do not enter a start date, the first available transaction is returned. If you do not enter an end date, the last available transaction is returned. Note that if you enter an end date, you also must enter a start date.
6. Press the **F5** key to authorize the transaction. If the customer has two or more accounts of the account number or account type specified and multiple account selection is not enabled, the system automatically selects which account to use based on an account selection hierarchy. If multiple account selection is enabled, the Account Selection screen is displayed. Select the individual account on which the statement download transaction is to be performed.
7. The Statement Download Response screen is displayed. This screen overlays the bottom half of the request screen. If the first transaction on the statement is a payment, the payment format of the Statement Download Response screen is displayed. If the first transaction on the statement is a transaction other than a payment transaction, the “other” format of the Statement Download Response screen is displayed. Up to three transactions can be displayed on the “other” format of the Statement Download Response screen. Transactions are displayed in the order they are posted. Convey the information on the screen to the customer.
8. If the message MORE INFORMATION AVAILABLE appears on the screen, press the **F9** key to display more information. When all transactions have been returned, the message NO MORE INFORMATION AVAILABLE is displayed.
9. If the customer wants to perform a different transaction, press the **F4** key to display the Transaction Menu.
10. If you have completed all transactions requested by this customer, press the **F2** key to display the Customer Verify Request screen in preparation for the next customer call.

Stopping Payment on a Check

The following procedure enables you to enter a check stop payment order on behalf of a BASE24-telebanking customer.

Assumptions: The customer has been verified for the current call.
 You are allowed to perform a check stop payment add transaction on behalf of the customer.

To enter a check stop payment order, perform the following:

1. From any CSR screen, press the **F4** key to display the Transaction Menu.
2. Select the CHECK STOP PAYMENT ADD transaction, and press the **F1** key. The Transaction Selection screen is displayed.
3. On the Transaction Selection screen, select the account type on which the check stop payment add transaction is to be performed (e.g., CHECK STOP PAYMENT ADD DDA), and press the **F1** key. Authorization Request screen 1 (check stop payment) is displayed.
4. Optionally enter the checking account number or qualifier, if this is known, in the ACCOUNT 1 NUMBER and QUALIFIER fields. If you do not enter a value, the system automatically selects the account from the account type specified or allow you to select an individual account from a list of all configured accounts of the specified type when you authorize the transaction.
5. Enter the check number (if you are stopping payment of a single check) or the highest check number (if you are stopping payment of a range of checks) in the CHECK NUMBER/HIGH CHECK NUMBER field.
6. If you are stopping payment on a range of checks, enter the lowest check number in the LOW CHECK NUMBER field. If you are stopping payment on a single check leave this field blank.
7. Optionally enter the following information:
 - The check amount in the AMOUNT field.
 - The currency code in the CURRENCY CODE field.
 - The date (YYYYMMDD) the check stop payment order becomes effective in the STOP DATE field. If this field is left blank, the current date is used.
 - The time (hhmmssstt) the check stop payment order becomes effective in the STOP TIME field. If this field is left blank, the current time is used.
 - The date (YYYYMMDD) of the check in the CHECK DATE field.

- The date (YYYYMMDD) the check stop payment order expires in the EXP DATE field. If this field is left blank, the check stop payment order does not expire.
 - A description of the check in the DESCRIPTION field.
8. Press the **F5** key to authorize the transaction. If the customer has two or more accounts of the account number or account type specified and multiple account selection is not enabled, the system automatically selects which account to use based on an account selection hierarchy. If multiple account selection is enabled, the Account Selection screen is displayed. Select the individual account on which the check stop payment add transaction is to be performed.
 9. The Check Stop Payment Response screen is displayed. This screen overlays the bottom half of the original Authorization Request screen.

A value of 000 is displayed in the ACTION CODE field if the check stop payment order was approved. A value other than 000 is displayed in the ACTION CODE field if the check stop payment order was denied. In this case, determine the appropriate action to take. Refer to the ***BASE24 Remote Banking Transaction Processing Manual*** for descriptions of all possible action codes.
 10. If the customer wants to perform a different transaction, press the **F4** key to display the Transaction Menu.
 11. If you have completed all transactions requested by this customer, press the **F2** key to display the Customer Verify Request screen in preparation for the next customer call.

ACI Worldwide Inc.

Section 4

Account List Inquiry Response

The Account List Inquiry Response screen is a BASE24-telebanking screen displayed when the customer account list inquiry transaction is approved. If this BASE24-telebanking transaction is denied, the Authorization Response screen is displayed instead.

The Account List Inquiry Response screen overlays the bottom half of Authorization Request screen 1 (account list inquiry/account list inquiry with balances) from which the transaction was entered. This enables you to view both the transaction request and response data at the same time.

The Account List Inquiry Response screen lists customer accounts that are configured to the system. If an account is not configured to the system, it cannot be displayed on this screen.

Screen 1 Function Keys

The use of three function keys on Account List Inquiry Response screen 1 differs from that specified for the standard CSR function keys explained in section 1. The use of these function keys is explained below.

The first column of information below shows the BASE24 keys. The second column describes the function that can be accomplished with these function keys.

Key	Description
F7	Change Account — This function is reserved for future use.
Shift-F7	Previous Accounts — Displays the previous one to five account rows defined for the customer's ID in the Customer/Account Relation Table (CACT). A configurable value defined for the Customer Service Interface controls the number of accounts returned each time this key is pressed. The ACCOUNT NUMBER field defines the default key path used with these keys. You must press the Shift-F8 keys at least once before you can retrieve any previous accounts using the Shift-F7 keys.
Shift-F8	More Accounts — Displays the next one to five accounts defined for the customer's ID in the Customer/Account Relation Table (CACT). A configurable value defined for the Customer Service Interface controls the number of accounts returned each time this key is pressed. The ACCOUNT NUMBER field defines the default key path used with these keys. You must press the Shift-F8 keys at least once before you can retrieve any previous accounts using the Shift-F7 keys.

Screen 1

Account List Inquiry Response screen 1 shows you customer application account information configured for the customer's ID in the system. This screen is displayed in response to a customer account list inquiry transaction.

This screen reports on up to five customer application accounts from the system at a time. If the customer has more than five accounts in the system, you can view all the customer's accounts using the **Shift-F7** and **Shift-F8** keys. A message indicating that more accounts are available is displayed if the customer has more accounts that are not currently displayed on the screen. A message indicating that no more accounts are available is displayed if there are no more accounts to display.

From this screen, you can also change customers, change transactions, or cancel the transaction by pressing the appropriate function key. The change accounts function is reserved for future use.

Note: To cancel a customer account list inquiry transaction, the customer's financial institution must allow nonfinancial transactions to be canceled.

A sample of the Account List Inquiry Response screen 1 is shown on the following page, followed by descriptions of its fields. Refer to section 7 for descriptions of fields from the Authorization Request screen 1 (account list inquiry/account list inquiry with balances) on which the transaction was requested. Only those fields that differ from Authorization Request screen 1 (account list inquiry/account list inquiry with balances) are described in this section.

```

ACTION CODE — A code indicating the processing outcome of the customer account list inquiry transaction. An action code of 000 indicates an approved response.

A text description is displayed to the right of the code.

Refer to the *BASE24 Remote Banking Transaction Processing Manual* for descriptions of all possible action codes.

Field Length: System-protected
Column Name: Not applicable

APPROVAL CODE — The approval code assigned to the customer account list inquiry transaction by the transaction authorizer. An approval code is a random number generated only when a transaction is approved. For denied transactions, this field is blank.

Field Length: System-protected
Column Name: Not applicable

DATE POSTED — The date, in YYMMDD format, this customer account list inquiry transaction was processed by a BASE24 product.

Field Length: System-protected
Column Name: Not applicable

ACCOUNT NUMBER — The account number of an application account.

Field Length: System-protected
Occurs: Up to 5 times
Column Name: CACT.ACCT

TYPE — A code indicating the type of application account (for example, DDA for a checking account and SAV for a savings account).

Field Length: System-protected
Occurs: Up to 5 times
Column Name: CACT.ACCT_TYP

QUAL — A user-defined code called an account qualifier that can be used in place of the application account number and account type to identify and access this account. The account qualifier is unique among all the customer's accounts.

Field Length: System-protected
Occurs: Up to 5 times
Column Name: CACT.ACCT_QUAL

FIID — The financial institution identifier (FIID) of the financial institution that owns this customer account.

Field Length: System-protected
Occurs: Up to 5 times
Column Name: CACT.FIID

STAT — A code indicating the current status of the application account and the action to be taken by the system if this account status is encountered during transaction processing. Valid values are as follows:

Value	Status	Action
0, A, B, C	No relationship (inactive account)	Deny transactions.
1, D, E, F, G, H, I	Open	Accept transactions.
2, J, K, L	Restricted to deposits	Accept all transactions except transfers, scheduled transfers, payments, and scheduled payments from this account.
3, M, N, O, P, Q, R	Open primary account	Accept transactions.
4, S, T, U	Primary account restricted to deposits	Accept all transactions except transfers, scheduled transfers, payments, and scheduled payments from this account.
9, V, W, X, Y, Z	Closed	Deny transactions.

BASE24 products do not distinguish between the alphabetic and numeric values grouped together above. The alphabetic values are intended to give institutions a wider range of values for assigning account statuses.

Field Length: System-protected
Occurs: Up to 5 times
Column Name: CACT.STAT

DESCRIPTION — A text description of this application account.

Field Length: System-protected
Occurs: Up to 5 times
Column Name: CACT.DESCR

DB — A code indicating whether the customer can perform debit transactions on the account. Debit transactions include transfers and payments from this account. Valid values are as follows:

Y = Yes, allow debit transactions.

N = No, do not allow debit transactions.

Field Length: System-protected
Occurs: Up to 5 times
Column Name: CACT.ACT_ALWD_DB

CR — A code indicating whether the customer can perform credit transactions on the account. Credit transactions include transfers and payments to this account. Valid values are as follows:

Y = Yes, allow credit transactions.

N = No, do not allow credit transactions.

Field Length: System-protected
Occurs: Up to 5 times
Column Name: CACT.ACT_ALWD_CR

INQ — A code indicating whether the customer can perform inquiry transactions (for example, available funds inquiry and last count of debit transactions inquiry transactions) on the account. Valid values are as follows:

Y = Yes, allow inquiry transactions.

N = No, do not allow inquiry transactions.

Field Length: System-protected
Occurs: Up to 5 times
Column Name: CACT.ACT_ALWD_INQ

ACI Worldwide Inc.

Section 5

Account List Inquiry with Balances Response

The Account List Inquiry with Balances Response screen is a BASE24-telebanking screen displayed when the account list inquiry with balances transaction is approved. If this BASE24-telebanking transaction is denied, the Authorization Response screen is displayed instead.

The Account List Inquiry with Balances Response screen overlays the bottom half of Authorization Request screen 1 (account list inquiry/account list inquiry with balances) from which the transaction was entered. This enables you to view both the transaction request and response data at the same time.

The Account List Inquiry with Balances Response screen displays the available balance or credit for customer accounts that are configured to the system. If an account is not configured to the system, it cannot be displayed on this screen.

Screen 1 Function Keys

The use of three function keys on Account List Inquiry with Balances Response screen 1 differs from that specified for the standard CSR function keys explained in section 1. The use of these function keys is explained below.

The first column of information below shows the BASE24 keys. The second column describes the function that can be accomplished with these function keys.

Key	Description
F7	Change Account — This function is reserved for future use.
Shift-F7	Previous Accounts — Displays balances for the previous one to three account rows defined for the customer's ID in the Customer/Account Relation Table (CACT). A configurable value defined for the Customer Service Interface controls the number of accounts returned each time this key is pressed. The ACCOUNT NUMBER field defines the default key path used with these keys. You must press the Shift-F8 keys at least once before you can retrieve balances for any previous accounts using the Shift-F7 keys.
Shift-F8	More Accounts — Displays balances for the next one to three accounts defined for the customer's ID in the Customer/Account Relation Table (CACT). A configurable value defined for the Customer Service Interface controls the number of accounts returned each time this key is pressed. The ACCOUNT NUMBER field defines the default key path used with these keys. You must press the Shift-F8 keys at least once before you can retrieve balances for any previous accounts using the Shift-F7 keys.

Screen 1

Account List Inquiry Response screen 1 shows you the available balance for customer application accounts configured for the customer's ID in the system. This screen is displayed in response to a account list inquiry with balances transaction.

This screen displays the available balance or credit for up to three customer application accounts from the system at a time. If the customer has more than three accounts in the system, you can view all the customer's accounts using the **Shift-F7** and **Shift-F8** keys. A message indicating that more accounts are available is displayed if the customer has more accounts that are not currently displayed on the screen. A message indicating that no more accounts are available is displayed if there are no more accounts to display.

From this screen, you can also change customers, change transactions, or cancel the transaction by pressing the appropriate function key. The change accounts function is reserved for future use.

Note: To cancel a account list inquiry with balances transaction, the customer's financial institution must allow nonfinancial transactions to be canceled.

An example of the Account List Inquiry with Balances Response screen 1 is shown on the following page, followed by descriptions of its fields. Refer to section 7 for descriptions of fields from the Authorization Request screen 1 (account list inquiry/account list inquiry with balances) on which the transaction was requested. Only those fields that differ from Authorization Request screen 1 (account list inquiry/account list inquiry with balances) are described in this section.

```

ACTION CODE — A code indicating the processing outcome of the account list inquiry with balances transaction. An action code of 000 indicates an approved response.

A text description is displayed to the right of the code.

Refer to the *BASE24 Remote Banking Transaction Processing Manual* for descriptions of all possible action codes.

Field Length: System-protected
Column Name: Not applicable

APPROVAL CDE — The approval code assigned to the account list inquiry with balances transaction by the transaction authorizer. An approval code is a random number generated only when a transaction is approved. For denied transactions, this field is blank.

Field Length: System-protected
Column Name: Not applicable

ACCOUNT NUMBER — The account number of an application account.

Field Length: System-protected
Occurs: Up to 3 times
Column Name: CACT.ACCT

TYPE — A code indicating the type of application account (for example, DDA for a checking account and SAV for a savings account).

Field Length: System-protected
Occurs: Up to 3 times
Column Name: CACT.ACCT_TYP

AVAIL BAL OR AVAIL CR — The current available balance or available credit, in whole and fractional currency units, of an application account. If an account has a negative balance, the amount is prefaced with a minus sign (-).

All amounts are displayed in the currency designated in the CRNCY CDE field.

Field Length: System-protected
Occurs: Up to 3 times
Data Names: PBF.PBFBASE.AVAIL-BAL
PBF.PBFBASE.AVAIL-CR

CRNCY CDE — A code identifying the currency of the amounts displayed for this account. Reserved values are listed in the 1990 ISO 4217 standard, *Codes for the Representation of Currencies and Funds*.

Field Length: System-protected
Occurs: Up to 3 times
Data Name: IDF.IDFBASE.CRNCY-CDE

BAL DATE — The date, in YYMMDD format, the balance amount displayed on the same line of the screen was determined.

Field Length: System-protected
Occurs: Up to 3 times
Data Name: Not applicable

FIID — The financial institution identifier (FIID) of the financial institution that owns this customer account.

Field Length: System-protected
Occurs: Up to 3 times
Column Name: CACT.FIID

ACT CDE — Three codes indicating whether the customer can perform specific types of transactions on an application account.

The first code indicates whether the customer can perform debit transactions on the account. Debit transactions include transfers and payments from this account. Valid values are as follows:

Y = Yes, allow debit transactions.
N = No, do not allow debit transactions.

The second code indicates whether the customer can perform credit transactions on the account. Credit transactions include transfers to this account. Valid values are as follows:

Y = Yes, allow credit transactions.
N = No, do not allow credit transactions.

The third code indicates whether the customer can perform inquiry transactions (for example, balance inquiry and scheduled transfer inquiry) on the account. Valid values are as follows:

Y = Yes, allow inquiry transactions.
N = No, do not allow inquiry transactions.

Field Length: System-protected
Occurs: Up to 3 times
Column Name: CACT.ACT_ALWD_DB
 CACT.ACT_ALWD_CR
 CACT.ACT_ALWD_INQ

DESCRIPTION — A text description for the application account.

Field Length: System-protected
Occurs: Up to 3 times
Column Name: CACT.DESCR

QUAL — A user-defined code called an account qualifier that can be used in place of the application account number and account type to identify and access this account. The account qualifier is unique among all the customer's accounts.

Field Length: System-protected
 Occurs: Up to 3 times
 Column Name: CACT.ACCT_QUAL

LEDG BAL OR CR LMT — The current ledger balance or credit limit, in whole and fractional currency units, of an application account. If an account has a negative ledger balance, the amount is prefaced with a minus sign (-).

The credit limit is the maximum amount of cash advances or purchases that can be executed from this account.

All amounts are displayed in the currency designated in the CRNCY CDE field.

Field Length: System-protected
 Occurs: Up to 3 times
 Data Names: PBF.PBFBASE.LEDG-BAL
 PBF.PBFBASE.CR-LMT

STAT — A code indicating the current status of the application account and the action to be taken by the system if this account status is encountered during transaction processing. Valid values are as follows:

Value	Status	Action
0, A, B, C	No relationship (inactive account)	Deny transactions.
1, D, E, F, G, H, I	Open	Accept transactions.
2, J, K, L	Restricted to deposits	Accept all transactions except transfers, scheduled transfers, payments, and scheduled payments from this account.
3, M, N, O, P, Q, R	Open primary account	Accept transactions.

Value	Status	Action
4, S, T, U	Primary account restricted to deposits	Accept all transactions except transfers, scheduled transfers, payments, and scheduled payments from this account.
9, V, W, X, Y, Z	Closed	Deny transactions.

BASE24 products do not distinguish between the alphabetic and numeric values grouped together above. The alphabetic values are intended to give institutions a wider range of values for assigning account statuses.

Field Length: System-protected
Occurs: Up to 3 times
Column Name: CACT.STAT

Section 6

Account Selection

The Account Selection screen is a BASE24-telebanking screen that enables you to select among multiple customer accounts with the same account type or with duplicate account numbers when you attempt to authorize a BASE24-telebanking transaction on the Authorization Request screen. The Account Selection screen is only used when multiple account selection has been enabled. To determine whether multiple account selection is enabled for your system, refer to section 1.

The Account Selection screen has the following display modes:

- Account descriptions only
- Account numbers only
- Account numbers and descriptions

The display mode is controlled by the setting of the MULTIPLE ACCOUNT SELECT DISPLAY field on screen 40 of the Institution Definition File (IDF). Refer to the *BASE24 Base Files Maintenance Manual* for more information about configuring the IDF.

The Account Selection screen displays only those accounts defined to the system that cannot be identified with the information provided in the request. It does not display all customer accounts defined to the system.

Up to 15 application account selections can be displayed on the Account Selection screen at one time. If more accounts exist than can fit on one screen, a message indicating that more account information is available will be displayed near the bottom of the screen. You can then press the **F9** key to display the additional accounts.

You select the account on which the transaction is to be performed either by entering the CODE value assigned to the account in the ENTER CODE FOR ACCOUNT field and pressing the **F1** key, or by positioning the cursor next to the account on the screen and pressing the **F1** key.

In either case, the account number and account qualifier for one account are returned to the Authorization Request screen and are displayed in the ACCOUNT 1 NUMBER and ACCOUNT 1 QUALIFIER, or ACCOUNT 2 NUMBER and ACCOUNT 2 QUALIFIER fields. Once the accounts are selected, the requested transaction is authorized.

If a transaction requires two accounts and they cannot be identified from the information provided in the request the first time you press the **F5** key, the accounts for the ACCOUNT 1 field are displayed on the Account Selection screen. The Account Selection will be displayed again for the ACCOUNT 2 field. Once both accounts are selected, the requested transaction is authorized.

Screen 1 Function Keys

The use of one function key on the Account Selection screen 1 differs from that specified for the standard CSR function keys explained in section 1. The use of this function key is explained below.

The first column of information below shows the BASE24 key. The second column describes the function that can be accomplished with this function key.

Key	Description
F9	More Accounts — Displays up to 15 more application accounts defined to the system for the customer's ID with the same account type or duplicate account numbers. This function is only valid when a message indicating that more account information is available is displayed on the screen.

Screen 1

Account Selection screen 1 shows you a list of all customer application accounts defined to the system with the same account type or duplicate account numbers. The Account Selection screen has three different display modes as discussed in the introduction. Samples of the Account Selection screen 1 for each of these display modes are provided below and on the following pages, followed by descriptions of their fields.

The following illustration shows Account Selection screen 1 in account numbers and descriptions display mode:

ENTER CODE FOR ACCOUNT — Enables you to select an account by entering the code value displayed on the same line of the screen as the account and pressing the **F1** key. The number (1 or 2) displayed at the end of this field name indicates whether you are selecting the account for the ACCOUNT 1 or ACCOUNT 2 field. For financial transactions, the *from* account is always displayed in the ACCOUNT 1 field and the *to* account is always displayed in the ACCOUNT 2 field.

Field Length: 1–2 numeric characters
Required Field: No
Default Value: No default value
Column Name: Not applicable

CODE — A number that can be placed in the ENTER CODE FOR ACCOUNT field to identify the account displayed on the same line of the screen for selection. You can also position the cursor next to this field and press the **F1** key to return the account number and account qualifier for the account identified on the same line of the screen to the Authorization Request screen.

Field Length: Cursor placement only
Occurs: Up to 15 times
Column Name: Not applicable

QUALIFIER — A user-defined code that can be used in place of the application account number and account type to identify and access this account.

Field Length: System-protected
Occurs: Up to 15 times
Column Name: CACT.ACCT_QUAL

ACCOUNT NUMBER — The application account number for this account.

Field Length: System-protected
Occurs: Up to 15 times
Column Name: CACT.ACCT

ACCOUNT DESCRIPTION — A text description for this application account.

Field Length: System-protected
Occurs: Up to 15 times
Column Name: CACT.DESCR

Section 7

Authorization Request

The Authorization Request screen is a BASE24-telebanking screen displayed any time you perform a BASE24-telebanking transaction. You can select BASE24-telebanking transactions from the Transaction Menu, the Transaction Selection screen, or by pressing the **F3** or **F6** key on either the Customer Verify Response or the Customer Personal Detail screen. The fields displayed on the Authorization Request screen vary according to the specific transaction selected.

The Authorization Request screen is used by both the BASE24-billpay product and the BASE24-telebanking product to authorize PIN change and PIN verify transactions. This screen is used by the BASE24-telebanking product to authorize all other BASE24-telebanking transactions.

The Authorization Request screen enables you to enter the specific information required for each transaction and to submit an authorization request for the transaction. Depending on the accounts specified, the transaction requested, and whether the transaction is approved or denied, one of the following screens is displayed in response:

- Account List Inquiry Response
- Account List Inquiry With Balances Response
- Account Selection
- Authorization Response
- Check Stop Payment Add Response
- Last Transaction Response
- Statement Closing Download Response
- Statement Download Response

Each of these response screens, except for the Account Selection screen, overlay the bottom half of the Authorization Request screen with response information. This enables you to view both the original authorization request information and the authorization response information at the same time.

The Account Selection screen is displayed when you need to select an account on which a transaction is to be performed. After you select an account on this screen, the account is returned to the Authorization Request screen.

The remainder of this section indicates how each of the various screen formats of the Authorization Request screen are displayed, followed by detailed function key, screen, and field descriptions for each format. Function key, screen, and field descriptions are provided in alphabetical order by screen format name.

Screen Formats

Because the Authorization Request screen displays different fields, depending on the BASE24-telebanking transaction selected, each of the possible screen formats is documented in this section. These formats are arranged in alphabetical order according to the names given to each of the possible screen formats. The following tables show you the specific screen formats that apply to each BASE24-telebanking transaction selected.

Transaction Menu Transactions

The following table shows the screen format of the Authorization Request displayed for BASE24-telebanking transactions selected on the Transaction Menu. The first column of the table lists the transaction selections on the Transaction Menu that cause the Authorization Request screen to be displayed. The second column of the table indicates the format of the Authorization Request screen for each selected transaction. For all other BASE24-telebanking transactions selected on the Transaction Menu, the Transaction Selection screen is displayed.

Transaction Menu Selection	Authorization Request Screen Format
ACCOUNT LIST	Account list inquiry/account list inquiry with balances
ACCOUNT LIST WITH BALANCES	
PIN CHANGE	PIN change [*]
PIN VERIFY	PIN verify [†]

^{*} The PIN change format of the Authorization Request screen is also displayed when you press the **F6** key on either the Customer Verify Response or Customer Personal Detail screens.

[†] The PIN verify format of the Authorization Request screen is also displayed when you press the **F3** key on either the Customer Verify Response or Customer Personal Detail screens.

Transaction Selection Screen Transactions

The following table shows the different formats of the Authorization Request screen displayed for each transaction selected on the Transaction Selection screen. The first column lists the transaction selections on the Transaction Selection screen that cause the Authorization Request screen to be displayed. The second column indicates the format of the Authorization Request screen for each selected transaction.

Transaction Selection	Authorization Request Screen Format
AVAIL FUNDS INQUIRY (no account types)	One-sided, set 1
AVAIL FUNDS INQUIRY (one account type)	
AVAIL FUNDS INQUIRY (two account types)	Dual available funds inquiry
CHECK CLEARANCE INQUIRY	Check clearance inquiry
CHECK STOP PAYMENT ADD	Check stop payment add
LAST COUNT CHECK	One-sided, set 2
LAST COUNT CREDIT	
LAST COUNT DB/CR	One-sided, set 3
LAST COUNT DEBIT	One-sided, set 2
LAST COUNT SOURCE	Last source inquiry
LAST COUNT TRANSFER	One-sided, set 1
STMT CLOSING DOWNLOAD INQ	One-sided, set 3
STMT DOWNLOAD INQ	One-sided, set 3
TRANSFER IMMED	Transfer or user-defined

One-Sided Transactions

One-sided BASE24-telebanking transactions involve a single customer account. The following BASE24-telebanking transactions are considered to be one-sided:

- AVAIL FUNDS INQUIRY (Available funds inquiry transaction on one account)
- CHECK STOP PAYMENT ADD (Check stop payment add transaction)
- LAST COUNT TRANSFER (Last count of account transfer transactions inquiry transaction)
- LAST COUNT CHECK (Last count of check transactions inquiry transaction)
- LAST COUNT DEBIT (Last count of debit transactions inquiry transaction)
- LAST COUNT CREDIT (Last count of credit transactions inquiry transaction)
- LAST COUNT DB/CR (Last count of debit/credit transactions inquiry transaction)
- STMT CLOSING DOWNLOAD INQ (Statement closing download transaction)
- STMT DOWNLOAD INQ (Statement download transaction)

One-sided transactions are organized into three sets. When you select a one-sided transaction on the Transaction Menu, the Transaction Selection screen is displayed. You must select the account types to be used for the transaction on the Transaction Selection screen. For each transaction selected on the Transaction Selection screen, a different format of the Authorization Request screen is provided, depending on the set to which the transaction belongs. Each set requires a specific set of information when you execute the transaction.

For all one-sided transactions, one customer account must be uniquely identified when you authorize the transaction. This can be accomplished by selecting the appropriate account type when you select the transaction on the Transaction Selection screen or by providing the account number (ACCOUNT 1 NUMBER) or account qualifier (ACCOUNT 1 QUALIFIER) when you authorize the transaction on the Authorization Request screen.

For transactions in set 2, you can optionally enter a transaction amount to refine the search parameters for the transactions returned in the inquiry.

For transactions in set 3, you can optionally enter a start and end date to refine the search parameters for the transactions reported.

Screen 1, Account List Inquiry/Account List Inquiry with Balances Format Function Keys

The use of one function key on Authorization Request screen 1 in the account list inquiry/account list inquiry with balances format differs from that specified for the standard CSR function keys explained in section 1. The use of this function key is explained below.

The first column of information below shows the BASE24 key. The second column describes the function that can be accomplished with this function key.

Key	Description
F5	Authorize — Requests authorization of the transaction displayed in the TRANSACTION field. Depending on whether the transaction is approved or denied, the Authorization Response or Account List Inquiry/Account List Inquiry with Balances Response screen is displayed.

Screen 1, Account List Inquiry/Account List Inquiry with Balances Format

Authorization Request screen 1 in the account list inquiry/account list inquiry with balances format enables you to enter and authorize a customer account list inquiry transaction or account list inquiry with balances transaction on behalf of a customer.

The customer account list inquiry transaction enables you to list all of the active customer accounts configured to the system for a customer ID. The account list inquiry with balances transaction enables you to list the available balance or available credit for these accounts.

Accounts with an inactive or closed status or with an effective date range that does not include the current date are not displayed with either inquiry.

When you select the ACCOUNT LIST INQUIRY transaction or ACCOUNT LIST INQ WITH BALANCES transaction on the Transaction Menu, Authorization Request screen 1 in the account list inquiry/account list inquiry with balances format is displayed. This screen enables you to authorize either inquiry by pressing the **F5** key. If the account list inquiry is approved, the Account List Inquiry Response screen is displayed. If the account list inquiry with balances is approved, the Account List Inquiry with Balances Response screen is displayed. If either inquiry is denied, the Authorization Response screen is displayed.

Authorization Request screen 1 in the account list inquiry/account list inquiry with balances format is shown below, followed by descriptions of its fields.

BANK — The name of the customer's financial institution. The value in this field was retrieved during customer verification processing.

Field Length: System-protected
Column Name: BANK.BANK_NAME

CUSTOMER ID — The unique identification number assigned to the customer. The value in this field was retrieved during customer verification processing.

Field Length: System-protected
Column Name: CSTT.PAN

ACCT NUMBER — An application account number for this customer. An account number is displayed in this field only if one was entered and retrieved during customer verification processing. Otherwise, this field is blank.

Field Length: System-protected
Column Name: CACT.ACCT

NAME — The customer's family name or last name, followed by the customer's given name or first name, and the customer's middle initial. The name displayed in these fields was retrieved during customer verification processing.

Field Length: System-protected
Column Names: PIT.NAM_FMLY
 PIT.NAM_GIVEN
 PIT.NAM_M_I

TRANSACTION — The transaction selected from the Transaction Menu when the Authorization Request screen was displayed. An example for the customer account list inquiry transaction is ACCOUNT LIST INQUIRY. An example for the account list inquiry with balances transaction is ACCOUNT LIST INQ WITH BALANCES.

Field Length: System-protected
Column Name: Not applicable

Screen 1, Check Clearance Inquiry Format Function Keys

The use of one function key on Authorization Request screen 1 in the check clearance inquiry format differs from that specified for the standard CSR function keys explained in section 1. The use of this function key is explained below.

The first column of information below shows the BASE24 key. The second column describes the function that can be accomplished with this function key.

Key	Description
F5	Authorize — Requests authorization of the transaction displayed in the TRANSACTION field. The Last Transaction Response screen is displayed. If two or more accounts exist in the system with the same specified account number or account type and multiple account selection is enabled, the system displays the Account Selection screen when you press the F5 key. You must then select an individual account from this screen before the transaction is authorized and the appropriate authorization response is displayed. To determine whether multiple account selection is enabled, refer to section 1.

Screen 1, Check Clearance Inquiry Format

Authorization Request screen 1 in the check clearance inquiry format enables you to enter a check clearance inquiry transaction on behalf of a customer.

The check clearance inquiry transaction enables you to determine whether a specific check for the customer has cleared. If the check has cleared, it will be returned in an approved response. If the check has not cleared, it will not be returned in an approved response.

Authorization Request screen 1 in the check clearance inquiry format is displayed when you select a CHECK CLEARANCE INQUIRY transaction on the Transaction Selection screen.

When the Authorization Request screen is first displayed for the check clearance inquiry transaction, any account number value retrieved during customer verification and displayed in the ACCT NUMBER field in the screen header also is displayed in the ACCOUNT 1 NUMBER field below. If you want to perform the transaction on an account that is different from this account, perform one of the following:

- Clear the account number displayed in the ACCOUNT 1 NUMBER field. The account with the specified account type from the Transaction Selection screen will be used.
- Enter a different account number in the ACCOUNT 1 NUMBER field, or clear the value in the ACCOUNT 1 NUMBER field and enter a valid account qualifier in the ACCOUNT 1 QUALIFIER field. The specified account will be used.

Once the account is identified, you must enter the number of the check to search for in the CHEQUE NUMBER field.

You can optionally specify the amount of the check in the AMOUNT field to further refine the search.

After all desired information is entered, press the **F5** key to execute the inquiry transaction. Either the Account Selection, Last Transaction Response, or Authorization Response screen is displayed.

The Account Selection screen is displayed if there are two or more customer accounts for the specified account with the same account number or account type. You must select an individual account from this screen before the transaction can be authorized and either the Last Transaction Response or Authorization Response

Field Length: System-protected
Column Name: CSTT.PAN

ACCT NUMBER — An application account number for this customer. An account number is displayed in this field only if one was entered and retrieved during customer verification processing. Otherwise, this field is blank.

Field Length: System-protected
Column Name: CACT.ACCT

NAME — The customer's family name or last name, followed by the customer's given name or first name, and the customer's middle initial. The name displayed in these fields was retrieved during customer verification processing.

Field Length: System-protected
Column Names: PIT.NAM_FMLY
PIT.NAM_GIVEN
PIT.NAM_M_I

TRANSACTION — The transaction and account type selected from the Transaction Selection screen when the Authorization Request screen was displayed. An example for the check clearance inquiry transaction is CHECK CLEARANCE INQUIRY DDA.

Field Length: System-protected
Column Name: Not applicable

ACCOUNT 1 NUMBER — The application account number on which this transaction is to be performed. If an account number is defined for the ACCT NUMBER field above, it is displayed in this field when you first enter the screen. Embedded spaces are not allowed.

Field Length: 1–19 numeric characters
Required Field: No
Default Value: No default value
Column Name: CACT.ACCT

ACCOUNT 1 QUALIFIER — A user-defined code that can be used in place of the application account number in the ACCOUNT 1 NUMBER field to identify and access this account. Embedded spaces are not allowed. If this field contains a value, a value is required in the CUSTOMER ID field.

Field Length: 1–4 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: CACT.ACCT_QUAL

CHEQUE NUMBER — The number of the check for which the customer wants to determine clearance. Embedded spaces are not allowed. The number you enter is right-justified and padded with leading zeros. For example, an entry of 1 is displayed as 000000000001.

Field Length: 1–12 numeric characters
Required Field: Yes
Default Value: No default value
Data Name: THF.ALT-KEY1.CHQ-NUM

AMOUNT — The amount of the check in whole and fractional currency units (for example, U.S. dollars and cents) for which the customer wants to determine clearance. A decimal point can be entered if the amount includes fractional currency units. A negative amount cannot be entered. This is an optional field used to refine the search for a particular check that matches both the check number and amount.

Field Length: 1–20 alphanumeric characters, with 19 numeric characters and 1 optional decimal point character
Required Field: No
Default Value: No default value
Column Name: Not applicable

CURRENCY CODE — A code that identifies the currency of the amount displayed in the AMOUNT field. Valid values are listed in the 1990 ISO 4217 standard, *Codes for the Representation of Currencies and Funds*.

A three-character description of the code entered is displayed to the right of the CURRENCY CODE field value.

Field Length: 3 numeric characters
Required Field: No
Default Value: The currency designated in the COBNAMES table for your system
Column Name: Not applicable

Screen 1, Check Stop Payment Add Format Function Keys

The use of one function key on Authorization Request screen 1 in the check stop payment format differs from that specified for the standard CSR function keys explained in section 1. The use of this function key is explained below.

The first column of information below shows the BASE24 key. The second column describes the function that can be accomplished with this function key.

Key	Description
F5	Authorize — Requests authorization of the transaction displayed in the TRANSACTION field. The Check Stop Payment Add Response screen is displayed indicating the processing outcome of the transaction. If multiple account selection is enabled and two or more accounts exist with the specified account number or account type, the system displays the Account Selection screen when you press the F5 key. You must then select an individual account from this screen before the transaction is authorized and the appropriate authorization response is displayed. To determine whether multiple account selection is enabled, refer to section 1.

Authorization Request screen 1 in the check stop payment format is shown below, followed by descriptions of its fields.

```
***** BASE24 *****
FILE DESTINATION:
F2-CHANGE CUSTOMER F4-TRANSACTION MENU F5-AUTHORIZE F7-CHANGE ACCT F12-HELP
```

Field Length: System-protected
Column Name: CSTT.PAN

ACCT NUMBER — An application account number for this customer. An account number is displayed in this field only if one was entered and retrieved during customer verification processing. Otherwise, this field is blank.

Field Length: System-protected
Column Name: CACT.ACCT

NAME — The customer's family name or last name, followed by the customer's given name or first name, and the customer's middle initial. The name displayed in these fields was retrieved during customer verification processing.

Field Length: System-protected
Column Name: PIT.NAM_FMLY
PIT.NAM_GIVEN
PIT.NAM_M_I

TRANSACTION — The transaction selected from the Transaction Selection screen when the Authorization Request screen was displayed. An example for the check stop payment add transaction is CHECK STOP PAYMENT ADD DDA.

Field Length: System-protected
Column Name: Not applicable

ACCOUNT 1 NUMBER — The application account number on which the check stop payment transaction is to be performed. If an account number is defined for the ACCT NUMBER field above, it is displayed in this field when you first enter the screen. Embedded spaces are not allowed in this field.

Field Length: 1–19 numeric characters
Required Field: No
Default Value: No default value
Column Name: CACT.ACCT

QUALIFIER — A user-defined code that can be used in place of the application account number in the ACCOUNT 1 NUMBER field to identify and access this account. Embedded spaces are not allowed in this field. If this field contains a value, a value is required in the CUSTOMER ID field.

Field Length: 1–4 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: CACT.ACCT_QUAL

CHK NUM/HI CHK NUM — The check number or numbers to which the check stop payment transaction applies. If the check stop payment transaction is for a range of check numbers, this field contains the highest check number. Embedded spaces are not allowed in this field. After verification, this field is zero filled to the left.

Field Length: 1–12 numeric characters
Required Field: Yes
Default Value: No default value
Column Name: Not applicable

LOW CHECK NUMBER — The first check number in a range of numbers to which the check stop payment transaction applies. If the check stop payment transaction is for a single check number, this field should be left blank. Embedded spaces are not allowed in this field. After verification, this field is zero filled to the left.

Field Length: 1–12 numeric characters
Required Field: No
Default Value: No default value
Column Name: Not applicable

AMOUNT — The amount of the check, in whole and fractional currency units, to which the check stop payment applies.

Field Length: 1–19 alphanumeric characters, with 18 numeric characters and 1 optional decimal point character
Required Field: No
Default Value: No default value
Column Name: Not applicable

CURRENCY CODE — A code that identifies the currency of the amount displayed in the AMOUNT field. Valid values are listed in the 1990 ISO 4217 standard, *Codes for the Representation of Currencies and Funds*.

A three-character description of the code entered is displayed to the right of the CURRENCY CODE field value.

Field Length: 3 numeric characters
Required Field: No
Default Value: The currency designated in the COBNAMES table for your system
Column Name: Not applicable

STOP DATE — The date, in YYYYMMDD format, that the check stop payment order becomes effective. If this field is blank, the system uses the current date.

Field Length: System-protected
Data Name: Not applicable

STOP TIME — The time, in hh:mm:ss format, that the check stop payment order becomes effective. If this field is left blank, the system uses the current time.

Field Length: System-protected
Data Name: Not applicable

CHECK DATE — The date (YYYYMMDD) the check to be stopped was written.

Field Length: 8 numeric characters
Required Field: No
Default Value: No default value
Column Name: Not applicable

EXP DATE — The date (YYYYMMDD) the check stop payment order expires. If this field is left blank, the check stop payment order does not expire.

Field Length: 8 numeric characters
Required Field: No
Default Value: No default value
Column Name: Not applicable

DESCRIPTION — A text description of the check stop payment order.

Field Length: 1–35 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: Not applicable

Screen 1, Dual Available Funds Inquiry Format Function Keys

The use of one function key on Authorization Request screen 1 in the dual available funds inquiry format differs from that specified for the standard CSR function keys explained in section 1. The use of this function key is explained below.

The first column of information below shows the BASE24 key. The second column describes the function that can be accomplished with this function key.

Key	Description
F5	Authorize — Requests authorization of the transaction displayed in the TRANSACTION field. The Authorization Response screen is displayed indicating the processing outcome of the transaction and the requested balances if approved. If multiple account selection is enabled and two or more accounts exist with the account number or account type specified for account 1 or account 2, the system displays the Account Selection screen when you press the F5 key. You must then select account 1 or account 2 from this screen before the transaction is authorized and the appropriate authorization response is displayed. Account 1 selections are always presented before account 2 selections. To determine whether multiple account selection is enabled, refer to section 1.

Screen 1, Dual Available Funds Inquiry Format

Authorization Request screen 1 in the dual available funds inquiry format enables you to enter a dual available funds inquiry transaction on behalf of a customer.

The dual available funds inquiry transaction enables you to check the funds currently available in two accounts simultaneously. Authorization Request screen 1 in the dual available funds inquiry format is displayed when you select an AVAIL FUNDS INQUIRY transaction for two account types (for example, SAV/DDA) from the Transaction Selection screen.

Checking the available funds of two accounts simultaneously is helpful in determining whether or not a transfer is required between two accounts or the amount that needs to be transferred.

When the Authorization Request screen is first displayed for the dual available funds inquiry transaction, any account number value retrieved during customer verification and displayed in the ACCT NUMBER field in the screen header also is displayed in the ACCOUNT 1 NUMBER field below. If you want to perform the transaction on a different account, perform one of the following:

- Clear the account number displayed in the ACCOUNT 1 NUMBER field. The account with the specified account type from the Transaction Selection screen will be used.
- Enter a different account number in the ACCOUNT 1 NUMBER field, or clear the value in the ACCOUNT 1 NUMBER field and enter a valid account qualifier in the ACCOUNT 1 QUALIFIER field. The specified account will be used.

If you want to check the available balance of an account that is different from the one specified by the second account type selected on the Transaction Selection screen, you must identify the account in either the ACCOUNT 2 NUMBER or ACCOUNT 2 QUALIFIER field.

After you have identified both accounts, press the **F5** key to execute the inquiry. Either the Account Selection screen or the Authorization Response screen 1 is displayed. The Account Selection screen is displayed if there are two or more customer accounts for the specified accounts that have the same account number or account type. You must select the individual accounts from this screen before the transaction can be authorized and the Authorization Response screen is displayed. Account 1 is always selected before account 2. The Authorization Response screen indicates the processing outcome of the requested transaction and the balances of both accounts.

If you want to perform additional dual available funds inquiry transactions using different customer accounts, you can press the **F7** key to redisplay the Transaction Selection screen. You can then choose the AVAIL FUNDS INQUIRY transaction with different account types (for example, SAV/CR instead of SAV/DDA).

Authorization Request screen 1 in the dual available funds inquiry format is shown below, followed by descriptions of its fields.

```

Column Name: BANK.BANK_NAME

CUSTOMER ID — The unique identification number assigned to the customer. The value in this field was retrieved during customer verification processing.

Field Length: System-protected
Column Name: CSTT.PAN

ACCT NUMBER — An application account number for this customer. An account number is displayed in this field only if one was entered and retrieved during customer verification processing. Otherwise, this field is blank.

Field Length: System-protected
Column Name: CACT.ACCT

NAME — The customer's family name or last name, followed by the customer's given name or first name, and the customer's middle initial. The name displayed in these fields was retrieved during customer verification processing.

Field Length: System-protected
Column Names: PIT.NAM_FMLY
PIT.NAM_GIVEN
PIT.NAM_M_I

TRANSACTION — The transaction and account types selected from the Transaction Selection screen when the Authorization Request screen was displayed. An example for the dual available funds inquiry transaction is AVAIL FUNDS INQUIRY SAV/DDA.

Field Length: System-protected
Column Name: Not applicable

ACCOUNT 1 NUMBER — The application account number of the first account for which the available balance is requested. If an account number is defined for the ACCT NUMBER field above, it is displayed in this field when you first enter the screen. Embedded spaces are not allowed.

Field Length: 1–19 numeric characters
Required Field: No
Default Value: No default value
Column Name: CACT.ACCT

ACCOUNT 1 QUALIFIER — A user-defined code that can be used in place of the application account number in the ACCOUNT 1 NUMBER field to identify and access the first account. Embedded spaces are not allowed. If this field contains a value, a value is required in the CUSTOMER ID field.

Field Length: 1–4 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: CACT.ACCT_QUAL

ACCOUNT 2 NUMBER — The application account number of a second account for which the available balance is requested. Embedded spaces are not allowed.

Field Length: 1–19 numeric characters
Required Field: No
Default Value: No default value
Column Name: CACT.ACCT

ACCOUNT 2 QUALIFIER — A user-defined code that can be used in place of the application account number in the ACCOUNT 2 NUMBER field to identify and access the second account. Embedded spaces are not allowed. If this field contains a value, a value is required in the CUSTOMER ID field.

Field Length: 1–4 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: CACT.ACCT_QUAL

Screen 1, Last Source Inquiry Format Function Keys

The use of one function key on Authorization Request screen 1 in the last source inquiry format differs from that specified for the standard CSR function keys explained in section 1. The use of this function key is explained below.

The first column of information below shows the BASE24 key. The second column describes the function that can be accomplished with this function key.

Key	Description
F5	Authorize — Requests authorization of the transaction displayed in the TRANSACTION field. The Authorization Response screen or the Last Transaction Response screen is displayed, depending on whether the transaction is approved or declined. If two or more accounts exist in the system with the same specified account number or account type and multiple account selection is enabled, the system displays the Account Selection screen when you press the F5 key. You must then select an individual account from this screen before the transaction is authorized and the appropriate authorization response is displayed. To determine whether multiple account selection is enabled, refer to section 1.

Screen 1, Last Source Inquiry Format

Authorization Request screen 1 in the last source inquiry format enables you to display a list of transactions by source (such as a remote banking device) for a customer account.

Authorization Request screen 1 in the last source inquiry format is displayed when you select a LAST COUNT SOURCE transaction on the Transaction Selection screen.

When the Authorization Request screen is first displayed for the last count of account by source transactions inquiry transaction, any account number value retrieved during customer verification and displayed in the ACCT NUMBER field in the screen header also is displayed in the ACCOUNT 1 NUMBER field below. If you want to perform the transaction on an account that is different from this account, perform one of the following:

- Clear the account number displayed in the ACCOUNT 1 NUMBER field. The account with the specified account type from the Transaction Selection screen will be used.
- Enter a different account number in the ACCOUNT 1 NUMBER field, or clear the value in the ACCOUNT 1 NUMBER field and enter a valid account qualifier in the ACCOUNT 1 QUALIFIER field. The specified account will be used.

Once the account is identified, you must enter a valid source code in the SOURCE CODE field, and press the **F5** key to execute this transaction. The Account Selection, Last Transaction Response, or Authorization Response screen is displayed.

The Account Selection screen is displayed if there are two or more customer accounts for the specified account with the same account number or account type. You must select an individual account from this screen before the transaction can be authorized and either the Last Transaction Response or Authorization Response screen is displayed.

The Last Transaction Response screen is displayed if the transaction is approved. Otherwise, the Authorization Response screen is displayed.

If you want to perform additional transactions of the same type, but using a different customer account (for example, a savings account instead of a checking account), you can press the **F7** key to redisplay the Transaction Selection screen. You can then choose the same transaction with a different account type (for example, SAV instead of DDA).

Authorization Request screen 1 in the last source inquiry format is shown below, followed by descriptions of its fields.

```

NAME — The customer's family name or last name, followed by the customer's given name or first name, and the customer's middle initial. The name displayed in these fields was retrieved during customer verification processing.

Field Length: System-protected
Column Names: PIT.NAM_FMLY
PIT.NAM_GIVEN
PIT.NAM_M_I

TRANSACTION — The transaction and account type selected from the Transaction Selection screen when the Authorization Request screen was displayed. An example for the last count of account by source transactions inquiry transaction is LAST COUNT SOURCE DDA.

Field Length: System-protected
Column Name: Not applicable

ACCOUNT 1 NUMBER — The application account number on which this transaction is to be performed. If an account number is defined for the ACCT NUMBER field above, it is displayed in this field when you first enter the screen. Embedded spaces are not allowed.

Field Length: 1–19 numeric characters
Required Field: No
Default Value: No default value
Column Name: CACT.ACCT

ACCOUNT 1 QUALIFIER — A user-defined code that can be used in place of the application account number in the ACCOUNT 1 NUMBER field to identify and access this account. Embedded spaces are not allowed. If this field contains a value, a value is required in the CUSTOMER ID field.

Field Length: 1–4 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: CACT.ACCT_QUAL

SOURCE CODE — A code indicating how transactions were originated. Only transactions that were originated by the source indicated in this field are retrieved in the last source inquiry transaction response. BASE24 reserved values are as follows:

A = ATM device
B = Remote banking device (for example, an interactive voice response system, personal computer, screen phone, customer service interface, third-party processor, kiosk, personal digital assistant, or the Internet)
P = POS device
T = Teller device
␣ = All of the above devices

A description of the code is displayed immediately to the right of the value in the SOURCE CODE field.

Field Length: 1 alphabetic character
Required Field: No
Default Value: ␣
Data Name: THF.ALT-KEY2.SRC

Screen 1, One-Sided, Set 1 Format Function Keys

The use of one function key on Authorization Request screen 1 in the one-sided, set 1 format differs from that specified for the standard CSR function keys explained in section 1. The use of this function key is explained below.

The first column of information below shows the BASE24 key. The second column describes the function that can be accomplished with this function key.

Key	Description
F5	Authorize — Requests authorization of the transaction displayed in the TRANSACTION field. Depending on the transaction requested and whether the transaction was approved or denied, the Authorization Response or Last Transaction Response screen is displayed. If two or more accounts exist in the system with the same specified account number or account type and multiple account selection is enabled, the system displays the Account Selection screen when you press the F5 key. You must then select an individual account from this screen before the transaction is authorized and the appropriate authorization response is displayed. To determine whether multiple account selection is enabled, refer to section 1.

Screen 1, One-Sided, Set 1 Format

Authorization Request screen 1 in the one-sided, set 1 format enables you to enter and authorize available funds inquiry and last count of account transfer transactions inquiry transactions on behalf of a customer.

The available funds inquiry transaction enables you to obtain the current balance of an individual customer account. The last count of account transfer transactions inquiry transaction enables you to view previous account transfers performed by or on behalf of the customer.

Note: The last count of account transfer transactions inquiry transaction returns only transfers that have completed. It does not return transfers that are currently scheduled and have not yet been performed.

Authorization Request screen 1 in the one-sided, set 1 format is displayed when you select either an AVAIL FUNDS INQUIRY transaction with no account types or one account type, or a LAST COUNT TRANSFER transaction on the Transaction Selection screen.

When Authorization Request screen 1 in the one-sided, set 1 format is first displayed for a one-sided transaction, any account number value retrieved during customer verification and displayed in the ACCT NUMBER field in the screen header also is displayed in the ACCOUNT 1 NUMBER field below. If you want to perform the transaction on an account that is different from this account, perform one of the following:

- Clear the account number displayed in the ACCOUNT 1 NUMBER field. The account with the specified account type from the Transaction Selection screen will be used.
- Enter a different account number in the ACCOUNT 1 NUMBER field, or clear the value in the ACCOUNT 1 NUMBER field and enter a valid account qualifier in the ACCOUNT 1 QUALIFIER field. The specified account will be used.

You must enter the appropriate information on the Authorization Request screen displayed and press the **F5** key to execute the transaction. The Account Selection, Authorization Response, or Last Transaction Response screen is then displayed.

The Account Selection screen is displayed if the customer has two or more accounts with the same account number or account type. You must select an individual account on this screen before the transaction is authorized and the appropriate response screen is displayed.

For approved or denied available funds inquiry transactions, the Authorization Response screen is displayed.

For approved last count of account transfer transactions inquiry transactions, the Last Transaction Response screen is displayed. Otherwise, the Authorization Response screen is displayed.

If you want to perform additional transactions of the same type, but using a different customer account (for example, a savings account instead of a checking account), you can press the **F7** key to redisplay the Transaction Selection screen. You can then choose the same transaction with a different account type (for example, SAV instead of DDA).

Authorization Request screen 1 in the one-sided, set 1 format is shown below, followed by descriptions of its fields.

```

BANK — The name of the customer’s financial institution. The value in this field was retrieved during customer verification processing.

Field Length: System-protected
Column Name: BANK.BANK_NAME

CUSTOMER ID — The unique identification number assigned to the customer. The value in this field was retrieved during customer verification processing.

Field Length: System-protected
Column Name: CSTT.PAN

ACCT NUMBER — An application account number for this customer. An account number is displayed in this field only if one was entered and retrieved during customer verification processing. Otherwise, this field is blank.

Field Length: System-protected
Column Name: CACT.ACCT

NAME — The customer's family name or last name, followed by the customer's given name or first name, and the customer's middle initial. The name displayed in these fields was retrieved during customer verification processing.

Field Length: System-protected
Column Names: PIT.NAM_FMLY
PIT.NAM_GIVEN
PIT.NAM_M_I

TRANSACTION — The transaction and account type selected from the Transaction Selection screen when the Authorization Request screen was displayed. Example transactions for one-sided, set 1 transactions are as follows, where *acct type* is the type of account on which the transaction is performed (for example, DDA for checking):

AVAIL FUNDS INQUIRY *acct type* = Available funds inquiry transaction
LAST COUNT TRANSFER *acct type* = last count of account transfer
transactions inquiry transaction

Field Length: System-protected
Column Name: Not applicable

ACCOUNT 1 NUMBER — The application account number on which this transaction is to be performed. If an account number is displayed for the ACCT NUMBER field above, it also is displayed in this field when you first enter the screen. Embedded spaces are not allowed in this field.

Field Length: 1–19 numeric characters
Required Field: No
Default Value: No default value
Column Name: CACT.ACCT

ACCOUNT 1 QUALIFIER — A user-defined code that can be used in place of the application account number in the ACCOUNT 1 NUMBER field to identify and access this account. Embedded spaces are not allowed in this field. If this field contains a value, a value is required in the CUSTOMER ID field.

Field Length: 1–4 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: CACT.ACCT_QUAL

Screen 1, One-Sided, Set 2 Format Function Keys

The use of one function key on Authorization Request screen 1 in the one-sided, set 2 format differs from that specified for the standard CSR function keys explained in section 1. The use of this function key is explained below.

The first column of information below shows the BASE24 key. The second column describes the function that can be accomplished with this function key.

Key	Description
F5	Authorize — Requests authorization of the transaction displayed in the TRANSACTION field. Depending on whether the transaction is approved or denied, the Authorization Response or the Last Transaction Response screen is displayed. If two or more accounts exist in the system with the same specified account number or account type and multiple account selection is enabled, the system displays the Account Selection screen when you press the F5 key. You must then select an individual account from this screen before the transaction is authorized and the appropriate authorization response is displayed. To determine whether multiple account selection is enabled, refer to section 1.

Screen 1, One-Sided, Set 2 Format

Authorization Request screen 1 in the one-sided, set 2 format enables you to enter and authorize last count of check transactions inquiry, last count of debit transactions inquiry, and last count of credit transactions inquiry transactions on behalf of a customer. By entering an amount in the AMOUNT field, you can refine these inquiry transactions to search for a particular check, debit, or credit transaction. These inquiry transactions allow you to view previous check, debit, or credit transactions performed on a particular customer account.

Authorization Request screen 1 in the one-sided, set 2 format is displayed when you select a LAST COUNT CHECK, LAST COUNT DEBIT, or LAST COUNT CREDIT transaction on the Transaction Selection screen.

When Authorization Request screen 1 in the one-sided, set 2 format is first displayed for a one-sided transaction, any account number value retrieved during customer verification and displayed in the ACCT NUMBER field in the screen header also is displayed in the ACCOUNT 1 NUMBER field below. If you want to perform the transaction on an account that is different from this account, perform one of the following:

- Clear the account number displayed in the ACCOUNT 1 NUMBER field. The account with the specified account type from the Transaction Selection screen will be used.
- Enter a different account number in the ACCOUNT 1 NUMBER field, or clear the value in the ACCOUNT 1 NUMBER field and enter a valid account qualifier in the ACCOUNT 1 QUALIFIER field. The specified account will be used.

You must enter the appropriate information on the Authorization Request screen displayed and press the **F5** key to execute the transaction. The Account Selection, Authorization Response, or Last Transaction Response screen is then displayed.

The Account Selection screen is displayed if the customer has two or more accounts with the same account number or account type. You must select an individual account on this screen before the transaction is authorized and the appropriate response screen is displayed.

The Last Transaction Response screen is displayed if the transaction is approved. The Authorization Response screen is displayed if the transaction is denied.

If you want to perform additional transactions of the same type, but using a different customer account (for example, a savings account instead of a checking account), you can press the **F7** key to redisplay the Transaction Selection screen. You can then choose the same transaction with a different account type (for example, SAV instead of DDA).

Authorization Request screen 1 in the one-sided, set 2 format is shown below, followed by descriptions of its fields.

```

BANK — The name of the customer's financial institution. The value in this field was retrieved during customer verification processing.

Field Length: System-protected
Column Name: BANK.BANK_NAME

CUSTOMER ID — The unique identification number assigned to the customer. The value in this field was retrieved during customer verification processing.

Field Length: System-protected
Column Name: CSTT.PAN

ACCT NUMBER — An application account number for this customer. An account number is displayed in this field only if one was entered and retrieved during customer verification processing. Otherwise, this field is blank.

Field Length: System-protected
Column Name: CACT.ACCT

NAME — The customer's family name or last name, followed by the customer's given name or first name, and the customer's middle initial. The name displayed in these fields was retrieved during customer verification processing.

Field Length: System-protected
Column Names: PIT.NAM_FMLY
PIT.NAM_GIVEN
PIT.NAM_M_I

TRANSACTION — The transaction selected from the Transaction Menu when the Authorization Request screen was displayed. Example values are as follows, where *acct type* is the type of account on which the transaction is performed (for example, DDA for checking or SAV for savings):

LAST COUNT CHECK *acct type* = last count of check transactions inquiry transaction
LAST COUNT DEBIT *acct type* = last count of debit transactions inquiry transaction
LAST COUNT CREDIT *acct type* = last count of credit transactions inquiry transaction

Field Length: System-protected
Column Name: Not applicable

ACCOUNT 1 NUMBER — The application account number on which this transaction is to be performed. If an account number is defined for the ACCT NUMBER field above, it is displayed in this field when you first enter the screen. Embedded spaces are not allowed in this field.

Field Length: 1–19 numeric characters
Required Field: No
Default Value: No default value
Column Name: CACT.ACCT

ACCOUNT 1 QUALIFIER — A user-defined code that can be used in place of the application account number in the ACCOUNT 1 NUMBER field to identify and access this account. Embedded spaces are not allowed in this field. If this field contains a value, a value is required in the CUSTOMER ID field.

Field Length: 1–4 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: CACT.ACCT_QUAL

AMOUNT — The amount of a particular check, debit, or credit transaction in whole and fractional currency units (for example, U.S. dollars and cents) for which the system is to search. A decimal point can be entered if the amount includes fractional currency units. A negative amount cannot be entered. This is an optional field used to refine last count of check transactions inquiry, last count of debit transactions inquiry, and last count of credit transactions inquiry transactions.

Field Length: 1–20 alphanumeric characters, with 19 numeric characters and 1 optional decimal point character
Required Field: No
Default Value: No default value
Column Name: Not applicable

CURRENCY CODE — A code that identifies the currency of the amount displayed in the AMOUNT field. Valid values are listed in the 1990 ISO 4217 standard, *Codes for the Representation of Currencies and Funds*.

A three-character description of the code entered is displayed to the right of the CURRENCY CODE field value.

Field Length: 3 numeric characters
Required Field: No
Default Value: The currency designated in the COBNAMES table for your system
Data Name: Not applicable

Screen 1, One-Sided, Set 3 Format Function Keys

The use of one function key on Authorization Request screen 1 in the one-sided, set 3 format differs from that specified for the standard CSR function keys explained in section 1. The use of this function key is explained below.

The first column of information below shows the BASE24 key. The second column describes the function that can be accomplished with this function key.

Key	Description
F5	Authorize — Requests authorization of the transaction displayed in the TRANSACTION field. Depending on whether the transaction is approved or denied, the Authorization Response, Last Transaction Response, Statement Closing Download Response, or Statement Download Response screen is displayed. If two or more accounts exist in the system with the same specified account number or account type and multiple account selection is enabled, the system displays the Account Selection screen when you press the F5 key. You must then select an individual account from this screen before the transaction is authorized and the appropriate authorization response is displayed. To determine whether multiple account selection is enabled, refer to section 1.

Screen 1, One-Sided, Set 3 Format

Authorization Request screen 1 in the one-sided, set 3 format enables you to enter and authorize last count of debit/credit transactions inquiry transactions on behalf of a customer. By optionally entering dates in the START DATE and END DATE fields, you can define a specific time period for which debit and credit transactions are reported. This inquiry transaction enables you to view previous transactions that either debited or credited a customer account.

Authorization Request screen 1 in the one-sided, set 3 format is displayed when you select a LAST COUNT DB/CR, STMT CLOSING DOWNLOAD INQ, or STMT DOWNLOAD INQ transaction on the Transaction Selection screen.

When Authorization Request screen 1 in the one-sided, set 3 format is first displayed for a one-sided transaction, any account number value retrieved during customer verification and displayed in the ACCT NUMBER field in the screen header also is displayed in the ACCOUNT 1 NUMBER field below. If you want to perform the transaction on an account that is different from this account, perform one of the following:

- Clear the account number displayed in the ACCOUNT 1 NUMBER field. The account with the specified account type from the Transaction Selection screen will be used.
- Enter a different account number in the ACCOUNT 1 NUMBER field, or clear the value in the ACCOUNT 1 NUMBER field and enter a valid account qualifier in the ACCOUNT 1 QUALIFIER field. The specified account will be used.

You must enter the appropriate information on the Authorization Request screen displayed and press the **F5** key to execute the transaction. The Account Selection, Authorization Response, or Last Transaction Response screen is then displayed.

The Account Selection screen is displayed if the customer has two or more accounts with the same account number or account type. You must select an individual account on this screen before the transaction is authorized and the appropriate response screen is displayed.

The Last Transaction Response screen is displayed if the last count debit/credit transaction is approved. The Statement Closing Download Response screen is displayed if the statement closing download transaction is approved. The Statement Download Response screen is displayed if the statement download transaction is approved. The Authorization Response screen is displayed if any of these transactions are denied.

If you want to perform additional transactions of the same type, but using a different customer account (for example, a savings account instead of a checking account), you can press the **F7** key to redisplay the Transaction Selection screen. You can then choose the same transaction with a different account type (for example, SAV instead of DDA).

Authorization Request screen 1 in the one-sided, set 3 format is shown below, followed by descriptions of its fields.

Field Length: System-protected
Column Names: PIT.NAM_FMLY
PIT.NAM_GIVEN
PIT.NAM_M_I

TRANSACTION — The transaction selected from the Transaction Menu when the Authorization Request screen was displayed. For example, LAST COUNT DB/CR *acct type* may be displayed in this field for the last count of debit/credit transactions inquiry transaction, where *acct type* is the type of account on which the transaction is performed (for example, DDA for checking or SAV for savings).

Field Length: System-protected
Column Name: Not applicable

ACCOUNT 1 NUMBER — The application account number on which this transaction is to be performed. If an account number is defined for the ACCT NUMBER field above, it is displayed in this field when you first enter the screen. Embedded spaces are not allowed in this field.

Field Length: 1–19 numeric characters
Required Field: No
Default Value: No default value
Column Name: CACT.ACCT

ACCOUNT 1 QUALIFIER — A user-defined code that can be used in place of the application account number in the ACCOUNT 1 NUMBER field to identify and access this account. Embedded spaces are not allowed in this field. If this field contains a value, a value is required in the CUSTOMER ID field.

Field Length: 1–4 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: CACT.ACCT_QUAL

START DATE — The starting date, in YYYYMMDD format, for which debit and credit transactions or statement information is to be reported for this account. Any debit or credit transactions that occurred prior to this date are not included in the transaction response. This is an optional field that enables you to refine last count of debit/credit transactions inquiry, statement closing download, or statement download transactions for a specific date range.

The date entered in this field must be less than the date entered in the END DATE field.

Field Length: 8 numeric characters
Required Field: No
Default Value: No default value
Column Name: Not applicable

END DATE — The ending date, in YYYYMMDD format, for which debit and credit transactions or statement information is to be reported for this account. Any debit or credit transactions that occurred after this date are not included in the transaction response. This is an optional field that enables you to refine last count of debit/credit transactions inquiry, statement closing download or statement download transactions for a specific date range.

The date entered in this field must be greater than the date entered in the START DATE field.

Field Length: 8 numeric characters
Required Field: No
Default Value: No default value
Column Name: Not applicable

Screen 1, PIN Change Format Function Keys

The use of one function key on Authorization Request screen 1 in the PIN change format differs from that specified for the standard CSR function keys explained in section 1. The use of this function key is explained below.

The first column of information below shows the BASE24 key. The second column describes the function that can be accomplished with this function key.

Key	Description
F5	Authorize — Validates the current PIN entered in the PIN field and requests authorization of the new PIN entered in the NEW PIN field. An action code displayed on the Authorization Response screen indicates whether or not the PIN change was approved. To ensure that the new PIN was entered as desired, you must re-enter the new PIN in the NEW PIN field and press the F5 key again.

Screen 1, PIN Change Format

Authorization Request screen 1 in the PIN change format enables you to change the existing personal identification number (PIN) or select the initial PIN for a customer.

Authorization Request screen 1 in the PIN change format is displayed when you select the PIN CHANGE transaction on the Transaction Menu, or press the **F6** key on either the Customer Verify Response screen or the Customer Personal Detail screen. It is also displayed when you attempt to display the Transaction Menu without first changing the customer's PIN when a PIN change transaction is required.

When the value in the PIN CHANGE REQUIRED field on the Customer Verify Response screen indicates that the existing PIN must be changed or an initial PIN must be selected, the only transaction allowed for the customer is the PIN change transaction.

To change the existing customer PIN on this screen, enter the current PIN in the PIN field and the new PIN in the NEW PIN field, and press the **F5** key. To ensure that the new PIN is entered correctly, you must enter it in the NEW PIN field again and press the **F5** key again (a screen message will prompt you to enter the new PIN).

To select the initial PIN for a customer on this screen, enter the initial PIN in the NEW PIN field and press the **F5** key. To ensure that the initial PIN is entered as desired, you must enter it in the NEW PIN field again and press the **F5** key again (a screen message will prompt you to re-enter the new PIN).

Note: For security reasons, the PIN you enter in the PIN or NEW PIN fields are not displayed on the screen.

After you press the **F5** key the second time, the Authorization Response screen is displayed. This screen displays an action and approval code indicating whether the PIN change was approved and the date the transaction was performed.

Authorization Request screen 1 in the PIN change format is shown below, followed by descriptions of its fields.

Screen 1, PIN Verify Format Function Keys

The use of one function key on Authorization Request screen 1 in the PIN verify format differs from that specified for the standard CSR function keys explained in section 1. The use of this function key is explained below.

The first column of information below shows the BASE24 key. The second column describes the function that can be accomplished with this function key.

Key	Description
F5	Authorize — Verifies the PIN entered in the PIN field. An action code displayed on the Authorization Response screen indicates whether or not the PIN was approved.

Screen 1, PIN Verify Format

Authorization Request screen 1 in the PIN verify format enables you to enter and authorize a PIN verify transaction on behalf of a customer. This transaction verifies a personal identification number (PIN) provided by the customer.

The PIN verification transaction is required by the customer's financial institution when the PIN OPTION field on the Customer Verify Response screen displays a value of PIN IS REQUIRED. The PIN verification transaction is preferred but not required by the customer's financial institution, when this field displays a value of PIN PREFERRED, NOT REQUIRED.

Authorization Request screen 1 in the PIN verify format is displayed when you select the PIN VERIFY transaction on the Transaction Menu, or when you press the **F3** key on the Customer Verify Response screen or the Customer Personal Detail screen. It is also displayed when you attempt to display the Transaction Menu without first verifying the customer's PIN when a PIN verify transaction is required.

To authorize the customer PIN, enter it in the PIN field and press the **F5** key. The Authorization Response screen is displayed. This screen displays an action code indicating whether the PIN was approved, the date the transaction was performed, and balance information for the customer's default account if one is defined for the customer's ID. Up to four different types of balances can be displayed for the default account, depending upon the type of account and the types of balances (that is, ledger, available funds, amount owed, amount due, and available credit) supported by the customer's financial institution.

Authorization Request screen 1 in the PIN verify format is shown below, followed by descriptions of its fields.

Screen 1, Transfer or User-Defined Format Function Keys

The use of one function key on Authorization Request screen 1 in the transfer or user-defined format differs from that specified for the standard CSR function keys explained in section 1. The use of this function key is explained below.

The first column of information below shows the BASE24 key. The second column describes the function that can be accomplished with this function key.

Key	Description
F5	Authorize — Requests authorization of the transaction displayed in the TRANSACTION field. Authorization Response screen 1 is displayed. If multiple account selection is enabled and two or more accounts exist with the account number or account type specified for the <i>from</i> account or <i>to</i> account, the system displays the Account Selection screen when you press the F5 key. You must then select the <i>from</i> or <i>to</i> account from this screen before the transaction is authorized and the appropriate authorization response is displayed. <i>From</i> account selections are always presented before <i>to</i> account selections. To determine whether multiple account selection is enabled, refer to section 1.

Screen 1, Transfer or User-Defined Format

Authorization Request screen 1 in the transfer or user-defined format enables you to enter a transfer – immediate or user-defined transaction on behalf of a customer.

The transfer – immediate transaction enables you to make an immediate transfer of funds between two customer accounts owned by the same financial institution.

The account debited by the transfer is the *from* account (the value in the ACCOUNT 1 field) while the account credited by the transfer is the *to* account (the value in the ACCOUNT 2 field). Future and recurring scheduled transfers must be performed using the BASE24-billpay product and the New Transfer screen. For more information on the New Transfer screen, refer to section 27 of this manual.

Note: A transfer between two customer accounts belonging to different financial institutions must be performed as a payment transaction. In this case, the financial institution owning the *to* account is considered the vendor and the *to* account is considered to be the customer account with the vendor. Payment transactions are performed using the BASE24-billpay product and the New Payment screen. For detailed information on the New Payment screen, refer to section 26 of this manual.

A user-defined transaction is any transaction provided by the service provider that is not included in the standard BASE24-telebanking transaction set. The transaction for a user-defined transaction must be defined in the Transaction Type by Source Code Table (TTSC) before it will appear on the Transaction Menu and in the Processing Code Definition File (PCDF) before it will appear on the Transaction Selection screen.

Authorization Request screen 1 in the transfer or user-defined format is displayed when you select a TRANSFER IMMED transaction or user-defined transaction on the Transaction Selection screen.

When the Authorization Request screen is first displayed for a transfer – immediate transaction, any account number value retrieved during customer verification and displayed in the ACCT NUMBER field in the screen header also is displayed in the ACCOUNT 1 NUMBER field below. If you want to transfer funds from an account that is different from this account, perform one of the following:

- Clear the account number displayed in the ACCOUNT 1 NUMBER field. The *from* account with the specified account type from the Transaction Selection screen will be used.

- Enter a different account number in the ACCOUNT 1 NUMBER field, or clear the value in the ACCOUNT 1 NUMBER field and enter a valid account qualifier in the ACCOUNT 1 QUALIFIER field. The specified account will be used as the *from* account.

If you want to transfer funds to an account that is different from the *to* account specified by the *to* account type selected on the Transaction Selection screen, you must identify the account in either the ACCOUNT 2 NUMBER or ACCOUNT 2 QUALIFIER fields.

Specify the amount to be transferred in the TRANSACTION AMOUNT field.

For user-defined transactions, you must enter the data required for the transaction. The exact data required for user-defined transactions is determined by the user.

After all required and desired information is entered, press the **F5** key to execute the transfer. Either the Account Selection screen or Authorization Response screen is displayed.

The Account Selection screen is displayed if there are two or more customer accounts for the specified *from* or *to* account that have the same account number or account type. You must select the individual *from* or *to* account from this screen before the transaction can be authorized and the Authorization Response screen is displayed. The *from* account is always selected before the *to* account.

The Authorization Response screen indicates the processing outcome of the requested transaction.

If you want to perform additional transfers using different customer accounts, you can press the **F7** key to redisplay the Transaction Selection screen. You can then choose the transfer – immediate transaction with different account types (for example, SAV, MRTGL instead of SAV, DDA).

Authorization Request screen 1 in the transfer or user-defined format is shown below, followed by descriptions of its fields.

```

BASE24-CORE  CUSTOMER SERVICE          LLLL          YY/MM/DD  hh:mm  01 OF 01

```

BANK — The name of the customer’s financial institution. The value in this field was retrieved during customer verification processing.

Field Length: System-protected
Column Name: BANK.BANK_NAME

CUSTOMER ID — The unique identification number assigned to the customer. The value in this field was retrieved during customer verification processing.

Field Length: System-protected
Column Name: CSTT.PAN

ACCT NUMBER — An application account number for this customer. An account number is displayed in this field only if one was entered and retrieved during customer verification processing. Otherwise, this field is blank.

Field Length: System-protected
Column Name: CACT.ACCT

NAME — The customer's family name or last name, followed by the customer's given name or first name, and the customer's middle initial. The name displayed in these fields was retrieved during customer verification processing.

Field Length: System-protected
Column Names: PIT.NAM_FMLY
PIT.NAM_GIVEN
PIT.NAM_M_I

TRANSACTION — The transaction and account types selected from the Transaction Selection screen when the Authorization Request screen was displayed. An example for the transfer between two accounts transaction is TRANSFER SAV, DDA.

Field Length: System-protected
Column Name: Not applicable

ACCOUNT 1 NUMBER — The application account number for the *from* account. This is the account debited in a transfer – immediate transaction. If an account number is defined for the ACCT NUMBER field above, it is displayed in this field when you first enter the screen. Embedded spaces are not allowed.

Field Length: 1–19 numeric characters
Required Field: No
Default Value: No default value
Column Name: CACT.ACCT

ACCOUNT 1 QUALIFIER — A user-defined code that can be used in place of the application account number in the ACCOUNT 1 NUMBER field to identify and access this *from* account. Embedded spaces are not allowed. If this field contains a value, a value is required in the CUSTOMER ID field.

Field Length: 1–4 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: CACT.ACCT_QUAL

ACCOUNT 2 NUMBER — The application account number for the *to* account. This is the account credited in a transfer – immediate transaction. Embedded spaces are not allowed.

Field Length: 1–19 numeric characters
Required Field: No
Default Value: No default value
Column Name: CACT.ACCT

ACCOUNT 2 QUALIFIER — A user-defined code that can be used in place of the application account number in the ACCOUNT 2 NUMBER field to identify and access this *to* account. Embedded spaces are not allowed. If this field contains a value, a value is required in the CUSTOMER ID field.

Field Length: 1–4 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: CACT.ACCT_QUAL

TRANSACTION AMOUNT — The amount to be transferred in whole and fractional currency units (for example, U.S. dollars and cents). A decimal point can be entered if the amount includes fractional currency units. A negative amount cannot be entered.

Field Length: 1–20 alphanumeric characters, with 19 numeric characters and 1 optional decimal point character
Required Field: Yes, if you are performing a transfer.
Default Value: No default value
Column Name: Not applicable

CURRENCY CODE — A code that identifies the currency of the amount displayed in the TRANSACTION AMOUNT field. Valid values are listed in the 1990 ISO 4217 standard, *Codes for the Representation of Currencies and Funds*.

A three-character description of the code entered is displayed to the right of the CURRENCY CODE field value.

Field Length: 3 numeric characters
Required Field: No
Default Value: The currency designated in the COBNAMES table for your system.
Data Name: Not applicable

Section 8

Authorization Response

The Authorization Response screen is a BASE24-telebanking screen that indicates the processing outcome of various BASE24-telebanking transactions. This screen is displayed for approved available funds inquiry, PIN change, PIN verify, transfer – immediate, or user-defined transactions. It is also displayed when any BASE24-telebanking transaction is denied.

The Authorization Response screen is used by both the BASE24-billpay and BASE24-telebanking products to display the response for PIN change and PIN verify transactions.

The Authorization Response screen overlays the bottom half of the Authorization Request screen on which the transaction was entered. This enables you to view the transaction request and response data at the same time. The Authorization Response screen displayed in response to PIN verify and PIN change transactions has a slightly different format from the Authorization Response screen displayed for all other transactions. Both screen formats are provided in this section. The screen 1 PIN transactions format is used for PIN verify and PIN change transactions. The screen 1 format is used for other transactions.

The Authorization Response screen displays an action code and description indicating whether the transaction was approved or denied. If the transaction was denied, the reason for the denial is provided. An approval code is displayed if the transaction was approved. The screen also displays the date the transaction was posted and balance information for approved balance inquiries and, optionally, for approved PIN verify transactions. The balance for the customer's default account number is displayed for approved PIN verify transactions, if a default account number has been configured for the customer.

The types of balances displayed on the Authorization Response screen depend on the type of transaction requested and the types of balances supported by the customer's financial institution.

Screen 1 Function Keys

The use of one function key on Authorization Response screen 1 differs from that specified for the standard CSR function keys explained in section 1. The use of this function key is explained below.

The first column of information below shows the BASE24 key. The second column describes the function that can be accomplished with this function key.

Key	Description
F4	Transaction Menu — Displays the Transaction Menu. Note: If you attempt to access this menu without first verifying or changing the customer's PIN when required, the appropriate Authorization Request screen 1 (PIN change or PIN verify) is displayed instead.

Screen 1

Authorization Response screen 1 shows you the response to approved available funds inquiry transactions and all other BASE24-telebanking transactions, except for PIN verify and PIN change transactions, that were denied. The Authorization Response screen displayed for PIN verify and PIN change transactions has a slightly different format and is documented later in this section. The balance information displayed on this screen is retrieved from the Positive Balance File (PBF) and is provided for approved available funds inquiry transactions only.

If you want to perform additional transactions of the same type, but using different customer accounts, you can press the **F7** key to redisplay the Transaction Selection screen. You can then choose the same transaction with different account types.

From this screen, you can also change customers, change transactions, or cancel the transaction by pressing the appropriate function key.

Note: To cancel a nonfinancial transaction, the customer's financial institution must allow nonfinancial transactions to be canceled.

A sample of Authorization Response screen 1 is shown below, followed by descriptions of its fields. Refer to section 7 for descriptions of fields from the corresponding Authorization Request screen on which the transaction was requested. In this sample, the Authorization Request screen 1 (dual available funds inquiry) is shown.

```

```

ACTION CODE — The action code indicating the processing outcome of the transaction. An action code of 000 indicates an approval.

A text description is displayed to the right of the code.

Refer to the *BASE24 Remote Banking Transaction Processing Manual* for descriptions of all possible action codes.

Field Length: System-protected
Data Name: Not applicable

ACTION INDICATOR — A code indicating the account type associated with action code 114 (no account of type requested). Valid values are as follows:

- 1 = Account 1 (single account or *from* account)
- 2 = Account 2 (*to* account)
- B = Backup account

Field Length: System-protected
Data Name: Not applicable

APPROVAL CODE — The approval code assigned to the transaction by the transaction authorizer. An approval code is a random number generated and displayed only when a transaction is approved. For denied transactions, this field is blank.

Field Length: System-protected
Data Name: Not applicable

DATE POSTED — The date, in YYMMDD format, the transaction was processed by a BASE24 product.

Field Length: System-protected
Data Name: Not applicable

AVAILABLE FOR WITHDRAWAL — The amount, in whole and fractional currency units, that is currently available for withdrawal from this account. This is the portion of the account balance that can be withdrawn without overdraft protection.

This field and its label are not displayed for any denied transactions.

Field Length: System-protected
Data Name: PBF.PBFBASE.AVAIL-BAL

BALANCE — The current balance, in whole and fractional currency units, of the accounts specified in the authorization request data fields. A description of the type of balance is displayed to the right of the balance amount. If an account has a negative balance, a minus sign may be displayed with the amount. Up to four different balances can be displayed for the accounts.

All balance amounts are displayed in the currency designated in the CRNCY field.

This field and its label are displayed only for approved available funds inquiries.

The possible balance descriptions that can be displayed are as follows:

BALANCE Description	Meaning
LEDGER 1	Displays the current ledger balance for account 1.
AVAILABLE 1	Displays the current available funds for account 1.
AMOUNT OWED	Displays the current amount owed for a loan account.
AMOUNT DUE	Displays the current amount due for a loan account.
AVAILABLE CREDIT	Displays the current amount of credit available for a credit or line of credit account.
LEDGER 2	Displays the ledger balance for account 2.
AVAILABLE 2	Displays the current available funds for account 2.

Note: Some or all of these balances may not be displayed if they are not supported by the customer's financial institution.

Field Length: System-protected
Occurs: Up to 4 times
Data Names: PBF.PBFBASE.AVAIL-BAL
PBF.PBFBASE.AVAIL-CR
PBF.PBFBASE.LEDG-BAL
PBF.PBFBASE.CR-BAL

CRNCY — A code identifying the currency of the balance amount displayed on the same line of the screen. Reserved values are listed in the 1990 ISO 4217 standard, *Codes for the Representation of Currencies and Funds*.

This field and its label are displayed for approved available funds inquiries only.

Field Length: System-protected
Occurs: Up to 4 times
Data Name: IDF.IDFBASE.CRNCY-CDE

DATE — The date, in YYMMDD format, the balance amount displayed on the same line of the screen was determined.

This field and its label are displayed for approved available funds inquiries only.

Field Length: System-protected

Occurs: Up to 4 times

Data Name: Not applicable

Screen 1, PIN Transactions Format

Authorization Response screen 1 in the PIN transactions format displays the response to PIN verify and PIN change transactions. The balance for the customer's default account number is also displayed for approved PIN verify transactions, if a default account number has been configured for the customer. From this screen, you can change customers, change transactions, or cancel the transaction by pressing the appropriate function key.

A sample of Authorization Response screen 1 in the PIN transactions format is shown below, followed by descriptions of its fields. In this sample, Authorization Response screen 1 in the PIN transactions format is shown overlaying Authorization Request screen 1 in the PIN verify format. Refer to section 7 for descriptions of Authorization Request screen 1 fields.

```

```

ACTION CODE — The action code indicating the processing outcome of the transaction. An action code of 000 indicates an approval.

A text description is displayed to the right of the code.

Refer to the *BASE24 Remote Banking Transaction Processing Manual* for descriptions of all possible action codes.

Field Length: System-protected
Data Name: Not applicable

APPROVAL CODE — The approval code assigned to the transaction by the transaction authorizer. An approval code is a random number generated and displayed only when a transaction is approved. For denied transactions, this field is blank.

Field Length: System-protected
Data Name: Not applicable

DATE POSTED — The date, in YYMMDD format, the transaction was processed by a BASE24 product.

Field Length: System-protected
Data Name: Not applicable

ACCOUNT 1 NUMBER — The default account number configured for this customer's ID. This is the account to which the balances displayed below apply.

For PIN verify transactions, this field and its label do not appear on the screen if a default account number is not defined for this customer's ID or if the PIN verify transaction is denied.

This field and its label are not displayed for PIN change transactions.

Field Length: System-protected
Column Name: CSTT.DFLT_ACCT

BALANCE — The current balance, in whole and fractional currency units, of the account displayed in the ACCOUNT 1 NUMBER field. A description of the type of balance is displayed to the right of the balance amount. If an account has a negative balance, a minus sign may be displayed with the amount. Up to four different balances can be displayed for the account.

All balance amounts are displayed in the currency designated in the CRNCY field. The possible balance descriptions that can be displayed are as follows:

BALANCE Description	Meaning
LEDGER 1	Displays the current ledger balance for account 1.
AVAILABLE 1	Displays the current available funds for account 1.
AMOUNT OWED	Displays the current amount owed for a loan account.
AMOUNT DUE	Displays the current amount due for a loan account.
AVAILABLE CREDIT	Displays the current amount of credit available for a credit or line of credit account.

Note: Some or all of these balances may not be displayed if they are not supported by the customer's financial institution.

For PIN verify transactions, this field and its label will not appear on the screen if a default account number is not defined for this customer's ID or if the PIN verify transaction is denied.

This field and its label are not displayed for PIN change transactions.

Field Length: 4 fields, system-protected
Data Names: PBF.PBFBASE.AVAIL-BAL
PBF.PBFBASE.AVAIL-CR
PBF.PBFBASE.LEDG-BAL
PBF.PBFBASE.CR-BAL

CRNCY — A code identifying the currency of the balance amount displayed on the same line of the screen. Reserved values are listed in the 1990 ISO 4217 standard, *Codes for the Representation of Currencies and Funds*.

For PIN verify transactions, this field and its label do not appear on the screen if a default account number is not defined for this customer's ID or if the transaction is denied.

This field and its label are not displayed for PIN change transactions.

Field Length: 4 fields, system-protected
Data Name: IDF.IDFBASE.CRNCY-CDE

DATE — The date, in YYMMDD format, the balance amount displayed on the same line of the screen was determined.

For PIN verify transactions, this field and its label do not appear on the screen if a default account number is not defined for this customer's ID or if the transaction is denied.

This field and its label are not displayed for PIN change transactions.

Field Length: System-protected
Data Name: Not applicable

ACI Worldwide Inc.

Section 9

Bank List

The Bank List screen is a BASE24-billpay screen that allows you to select a financial institution when signing up a new customer for BASE24-billpay service. The Bank List screen displays information for all financial institutions currently defined to the system. Financial institutions can be added to the system by back-office personnel only.

The Bank List screen allows you to scroll forward or backward through a list of financial institution entries using the **Shift-F7** and **Shift-F8** keys. The usage of these keys is explained on the following pages.

The Bank List screen is displayed when you attempt to access the Customer Signup screen from either the Customer Verify Request screen or the Transaction Menu and a financial institution has not yet been selected for the customer. Once the Customer Signup screen is displayed, you can still access the Bank List screen to change financial institutions by pressing the **Shift-F6** keys before the customer ID is added.

Information for up to six financial institutions can be displayed on the screen at one time. When you find the financial institution you need, position the cursor to the same line of the screen and press the **F1** key to select and display the financial institution information on the Customer Signup screen.

Besides selecting and returning financial institution information from the Bank List screen, you can also access the Customer Verify Request screen using the **F2** key to change customers or the Transaction Menu using the **F4** key to change transactions.

Other than the customer header fields, all fields displayed on the Bank List screen are configured using the Bank Table screen. For additional information on the Bank Table screen, refer to the ***BASE24 Base Files Maintenance Manual***.

Screen 1 Function Keys

The use of three function keys on Bank List screen 1 differs from that specified for the standard CSR function keys explained in section 1. The use of these function keys is explained below.

The first column of information below shows the BASE24 keys. The second column describes the functions that can be accomplished with these function keys.

Key	Description
F1	Select Bank and Return — Selects the financial institution displayed on the same line of the screen as the cursor and returns this information to the Customer Signup screen.
Shift-F7	Previous — Retrieves the previous six financial institution rows stored in the Bank Table (BANK) with a Bank or FIID field value less than that of the first financial institution row currently displayed on the screen. The BANK or FIID fields at the top of the screen define the selected key path for this screen. You must use the BANK or FIID field at least once with the Shift-F8 keys before the value of the Bank or FIID field for the first financial institution row currently displayed is used as the selected key path with the Shift-F7 keys. Both the BANK and FIID fields at the top of the screen must be blank when the Shift-F7 keys are pressed.

Key	Description
Shift-F8	Next — Retrieves the next six financial institution rows stored in the Bank Table (BANK). Values in the BANK and FIID fields when these keys are pressed determine the order in which entries are arranged, as follows: • If the BANK field contains a value and the FIID field is blank, this value is used as a starting point to select the next six financial institution rows displayed. • If the FIID field contains a value and the BANK field is blank, this value is used as a starting point to select the next six financial institution rows displayed. • If both the BANK and FIID fields are blank, the value in the Bank or FIID field for the last financial institution row currently displayed is used to select the next six financial institution rows displayed, depending on the key path last used. You must enter a value in either the BANK or FIID field the first time you use the Shift-F8 keys. Thereafter, you can use the Shift-F8 keys with or without a value in the BANK or FIID field.

Screen 1

Bank List screen 1 allows you to select financial institution information to be returned to the Customer Signup screen. Bank List screen 1 is shown below, followed by descriptions of its fields.

```

BASE24-CORE  BANK LIST                      LLLL          YY/MM/DD  hh:mm  01 OF 01

```

BANK — The full or partial name of a financial institution you want to use as a starting point to search for BANK rows. For more information on how this field is used to search the BANK, refer to the description of the **Shift-F8** function keys provided earlier in this section.

Spaces that precede the name or are embedded in the name are considered part of the financial institution name. Spaces following the name are not considered part of the financial institution name.

Field Length:	1–22 alphanumeric characters
Required Field:	No
Default Value:	No default value
Column Name:	Not applicable

FIID — The full or partial FIID of a financial institution you want to use as a starting point to search for BANK rows. For more information on how this field is used to search the BANK, refer to the description of the **Shift-F8** function keys provided earlier in this section.

Field Length: 1–4 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: Not applicable

Bank — The name of the financial institution to be selected. Spaces that precede the name or are embedded in the name are considered part of the name. When you place the cursor in this field and press the **F1** key, the financial institution information displayed on the same line of the screen is selected and returned to the Customer Signup screen.

Note: If you select a financial institution with the Cust DB Preload field set to a value of Y, the system returns you to the screen or menu from which you attempted to access the Customer Signup screen.

Field Length: Cursor placement only
Required Field: No
Default Value: No default value
Column Name: BANK.BANK_NAME

FIID — The FIID of the financial institution. The FIID is an identifier that must be unique within the logical network. It is used throughout BASE24 products to identify each BASE24 institution.

Field Length: System-protected
Column Name: BANK.FIID

Main Brnch — The main branch number for this financial institution. This is the branch to which customers for this financial institution are referred for additional information on their BASE24-billpay service.

Field Length: System-protected
Column Name: BANK.MAIN_BR_NUM

Institution ID — The financial institution's routing and transit number or issuer identification number.

In the United States, this field can contain a routing and transit number of nine characters.

Field Length: System-protected
Column Name: BANK.INST_ID

Date Range — The range of dates for which the BASE24-billpay product is available for use by this financial institution's customers in transaction processing. This field actually consists of two subfields, each of which is described below.

The first subfield contains the date on which the BASE24-billpay product will become available for use by this institution's customers.

The second subfield immediately below contains the date on which the BASE24-billpay product will no longer be available for use by this institution's customers. If blanks are displayed in this subfield, no expiration date is set.

Together, these subfields allow users to predefine financial institutions to the BASE24-billpay database prior to their actual implementation of service. These fields could also define a trial or contracted usage period for an institution.

The format in which the dates in this field are displayed is provided immediately below the Date Range field label on the screen.

Field Length: System-protected
Column Names: BANK.BEG_DATE
 BANK.END_DATE

CustVend Initial Verify — The initial default customer vendor verification status to be used when adding customer vendors for this institution's BASE24-billpay customers. This code indicates the status of the customer's account with the vendor. This status is displayed in the Status field on the Customer Vendor Detail screen when a new customer vendor is added.

A customer cannot direct payments to a vendor until the customer's account with the vendor has a status of VERIFIED. The procedures required to verify a customer account with a vendor are dictated by the customer's financial institution or by the service provider. All values except for VERIFIED are considered to

indicate an unverified status and require that some type of action be taken to verify the customer's account with the vendor. The possible CustVend Initial Verify field values are described in the following table.

Value	Description
FAILED	Failed. The customer's account with the customer vendor failed verification. The customer vendor is considered to be unverified.
INITIAL	Initial. The customer vendor is considered to be unverified.
USER-DFN	User-defined. The customer vendor is considered to be unverified.
VERIFIED	Verified. The customer's account with the customer vendor has been verified. The customer is allowed to direct payments to the customer vendor.

Field Length: System-protected
Column Name: BANK.INIT_VRFY_CUST_VEND

Cust DB Preload — A code indicating whether the data for this financial institution's customers was automatically preloaded from an existing database or tape. Valid values are as follows:

Y = Yes, customer data for this institution was automatically preloaded from an existing database or tape. The verification status assigned to the preloaded customer data is determined by the institution.

N = No, customer data for this institution was not automatically preloaded from an existing database. New customers must be manually added on an individual basis. Default data configured for the institution is displayed in the Customer Signup and Customer Signup Accounts screen fields when you sign up a new customer.

Field Length: System-protected
Column Name: BANK.CUST_DB_PRE_LOAD

ACI Worldwide Inc.

Section 10

Branch List

The Branch List screen is a BASE24-billpay screen that enables you to view all branches configured for a specific financial institution in the system. From the list of branches displayed, you can select the information for a specific branch to be returned to the Customer Information or Customer Signup screens. For the BASE24-billpay product, a financial institution branch is the main branch providing service for a BASE24-billpay customer. You can refer a customer to their financial institution branch for additional information on their BASE24-billpay service.

The Branch List screen can be accessed from either the Customer Information or Customer Signup screens by pressing the **Shift-F5** keys. Upon entry to this screen, the system automatically displays the first three branches for the financial institution name specified on the screen previously accessed. This financial institution name is displayed in the BANK field.

You can then use the **Shift-F7** or **Shift-F8** keys to scroll through the list of branches for the specified financial institution. Up to three branch entries can be viewed on the screen at one time. When you find the branch you want to select, position the cursor in the selection field on the same line as the branch and press the **F1** key to select the branch and return it to the screen accessed previously.

Screen 1 Function Keys

The use of three function keys on Branch List screen 1 differs from that specified for the standard CSR function keys explained in section 1. The use of these function keys is explained below.

The first column of information below shows the BASE24 keys. The second column describes the functions that can be accomplished with these function keys.

Key	Description
F1	Select Branch and Return — Selects the branch entry displayed on the same line of the screen as the cursor and returns the branch information to the previously accessed screen.
Shift-F7	Previous — Retrieves the previous three branch rows stored in the Bank Branch Table (BKBR) for this financial institution with a City field value less than that of the first bank branch row currently displayed on the screen. The CITY field defines the selected key path for this screen. You must use the CITY field at least once with the Shift-F8 keys before the value of the City field for the first bank branch row currently displayed is used as the selected key path with the Shift-F7 keys. The CITY field must be blank when the Shift-F7 keys are pressed.
Shift-F8	Next — Retrieves the next three branch rows stored in the Bank Branch Table (BKBR) for this financial institution. The value in the CITY field when these keys are pressed determines the next three branch rows displayed, as follows: • If the CITY field contains a value, this value is used as a starting point to select the next three branch rows displayed. • If the CITY field does not contain a value, the value in the City field for the last branch row currently displayed is used to select the next three branch rows displayed. You must enter a value in the CITY field the first time you use the Shift-F8 keys. Thereafter, you can use the Shift-F8 keys with or without a value in the CITY field.

Screen 1

Branch List screen 1 allows you to select an individual branch for which branch information is to be returned. Branch List screen 1 is shown below, followed by descriptions of its fields.

BANK — The name of the financial institution for the customer. The name displayed in this field is obtained from the screen from which you accessed the Branch List screen.

Field Length: System-protected
Column Name: BANK.BANK_NAME

CITY — The city in which you want to search for the next three branches of this financial institution. You can search using a full or partial city name. After pressing the **Shift-F8** keys, this field is reset to blanks.

Field Length: 1–25 alphanumeric characters
Required Field: Yes, if searching using a city name.
Default Value: No default value
Column Name: BKBR.CITY

Branch Number — The branch number identifying this branch of the financial institution.

Field Length: System-protected
Column Name: BKBR.BR_NUM

Address — The street or mailing address of this financial institution branch. Up to two lines of address information can be displayed.

Field Length: System-protected
Column Names: BKBR.ADDR_1
BKBR.ADDR_2

City — The city where this financial institution branch is located.

Field Length: System-protected
Column Name: BKBR.CITY

State — The two-letter U.S. state or Canadian province abbreviation for this financial institution branch mailing address. Reserved state codes are defined in the 1988 ANSI X3.38 standard, *Identification of the States, the District of Columbia, and the Outlying and Associated Areas of the United States for Information Interchange*.

Field Length: System-protected
Column Name: BKBR.ST

Postal Code — The postal code for the mailing address of this financial institution branch.

Field Length: System-protected
Column Name: BKBR.POSTAL_CODE

<branch name> — Identifies a financial institution branch to be selected. When the cursor is placed in this field and you press the **F1** key, the selected branch information is returned to the Customer Signup screen.

Field Length:	Cursor placement only
Occurs:	Up to 3 times
Required Field:	No
Default Value:	No default value
Column Name:	Not applicable

Contact

The following fields identify a contact person at the financial institution branch to whom the customer can be referred for additional information on his or her BASE24-billpay service.

Name — The name of a contact person at this financial institution branch to whom the customer can be referred for additional information on his or her BASE24-billpay service.

Field Length:	System-protected
Column Name:	BKBR.CONTACT_PERSON

Phone — A phone number the customer can use to reach the person identified in the Name field.

Field Length:	System-protected
Column Name:	BKBR.PHN

Fax — A fax number the customer can use to reach the person identified in the Name field.

Field Length:	System-protected
Column Name:	BKBR.PHN_FAX

ACI Worldwide Inc.

Section 11

Check Stop Payment Add Response

The Check Stop Payment Add Response screen is a BASE24-telebanking screen displayed when a check stop payment add transaction is authorized.

The Check Stop Payment Add Response screen overlays the bottom half of the Authorization Request screen in the check stop payment add format. This enables you to view the request and response data at the same time.

The Check Stop Payment Add Response screen displays an action code and description indicating whether the transaction was approved or denied. If the transaction was denied, the reason for the denial is provided. An approval code is displayed if the transaction was approved. The screen also displays the date the check stop payment add transaction was posted.

Screen 1

Check Stop Payment Add Response screen 1 shows you an approved response to a check stop payment add transaction.

Check Stop Payment Add Response screen 1 is shown below, followed by descriptions of its fields. Refer to section 7 for descriptions of the fields from the Authorization Request screen in the check stop payment add format on which the check stop payment add transaction was requested.

BASE24-CORE		CUSTOMER SERVICE	LLLL	YY/MM/DD	hh:mm	01 OF 01

ACTION CODE — A code indicating the processing outcome of the inquiry transaction. An action code of 000 indicates an approved response.

A text description is displayed to the right of the code.

Refer to the *BASE24 Remote Banking Transaction Processing Manual* for descriptions of all possible action codes.

Field Length: System-protected

Column Name: Not applicable

ACTION INDICATOR — A code indicating the account type associated with action code 114 (no account type requested). When used, this field contains a value of 1, indicating account 1.

Field Length: System-protected

Column Name: Not applicable

APPROVAL CODE — The approval code assigned to the transaction by the transaction authorizer. An approval code is a random number generated for an approved transaction. For denied transactions, this field is blank.

Field Length: System-protected

Column Name: Not applicable

DATE POSTED — The date, in YYMMDD format, the transaction was processed by a BASE24 product.

Field Length: System-protected

Data Name: Not applicable

ACI Worldwide Inc.

Section 12

Customer Account List

The Customer Account List screen is a BASE24-billpay screen that enables you to view all customer application accounts defined to the system for the customer's ID. From this screen, you can add, update, activate, deactivate, or delete accounts, or you can select an individual *from* account or *to* account on which a BASE24-billpay transaction is to be performed.

The Customer Account List screen can be accessed from any BASE24-billpay CSR screen on which you need to list accounts or select a *from* account or *to* account to perform a BASE24-billpay transaction (that is, the Customer Signup, Customer Information, New Payment, New Transfer, Scheduled Payment Detail, and Scheduled Transfer Detail screens). The Customer Account List screen is displayed when you press the **Shift-F4** or **Shift-F5** keys on the New Payment, New Transfer, Scheduled Payment Detail, or Scheduled Transfer Detail screens, or the **F13** key on the Customer Signup or Customer Information screens.

Upon entry to this screen, the system automatically reads up to four application accounts defined for the customer in the Customer/Account Relation Table (CACT) and displays them on the screen. You can then press the **Shift-F7** or **Shift-F8** keys to view the previous four accounts or the next four accounts for the customer, respectively.

To select an account, position the cursor on the account entry and press the **F1** key to select it and return the account information to the previous screen accessed.

To add an account, enter the new account information in the New fields and press the **F5** key.

To update an account, position the cursor on the account entry to be updated, update the desired information, and press the **F8** key. Information can be updated in the following fields only: Qualifier, Allowed: DB, Allowed: CR, Allowed: INQ, and Description.

To activate, deactivate, or delete an account, position the cursor on the account entry and press the appropriate function key (**F15**, **F6**, or **F13**, respectively).

If the account the customer wants to use does not exist in the CACT, you can use it by entering the account number and account type or the account qualifier on the first line of account entries and selecting it. You can do this only if the customer's financial institution allows customers to use accounts that are not already configured in the CACT.

If your system does not use the Customer/Account Relation Table (CACT)—that is, the CACT-PRESENT param in the Logical Network Configuration File is set to the value N—the Customer Account List screen is displayed with no account numbers and the following message is displayed: “The customer account table has not been enabled for use by the server.” In this case, you must enter the appropriate account information on the first line of account entries and select it.

Screen 1 Function Keys

The use of five function keys on Customer Account List screen 1 differs from that specified for the standard CSR function keys explained in section 1. The use of these function keys is explained below.

The first column of information below shows the BASE24 keys. The second column describes the functions that can be accomplished with these function keys.

Key	Description
F1	<Key Description> — Selects the <i>from</i> account or <i>to</i> account and returns the account to the original screen. The descriptions that are displayed for this function key are as follows: Not Available Select FROM Account Select TO Account
F5	Add — Adds a new customer account.
F13	Delete — Deletes the selected customer account.
Shift-F7	Previous — Retrieves the previous four accounts defined to the system for this customer ID. The Account Number field defines the default key path used with these keys. The first account entry currently displayed on the screen before the Shift-F7 keys are pressed becomes the last entry displayed after the keys are pressed.
Shift-F8	Next — Retrieves the next four accounts defined to the system for this customer ID. The Account Number field defines the default key path used with these keys. The last account entry currently displayed on the screen before the Shift-F8 keys are pressed becomes the first entry displayed after the keys are pressed.

Screen 1

Customer Account List screen 1 enables you to add, update, activate, deactivate, or delete application accounts, or select individual customer application accounts on which a BASE24-billpay transaction is to be performed. Customer Account List screen 1 is shown below, followed by descriptions of its fields.

```

BANK — The name of the customer's financial institution. The value in this field was retrieved during customer verification processing.

Field Length:	System-protected
Column Name:	BANK.BANK_NAME

CUSTOMER ID — The unique identification number assigned to the customer. The value in this field was retrieved during customer verification processing.

Field Length: System-protected
Column Name: CSTT.PAN

ACCT NUMBER — An application account number for this customer. An account number is displayed in this field only if one was entered and retrieved during customer verification processing. Otherwise, this field is blank.

Field Length: System-protected
Column Name: CACT.ACCT

NAME — The customer's family name or last name, followed by the customer's given name or first name, and the customer's middle initial. The name displayed in these fields was retrieved during customer verification processing.

Field Length: System-protected
Column Names: PIT.NAM_FMLY
PIT.NAM_GIVEN
PIT.NAM_M_I

<Mode Description> —The function of the account in the transaction. Valid values are as follows:

Customer Account List = This value is displayed if the screen is accessed from the Customer Information or Customer Signup screens.
Select FROM Account = The account from which funds are being transferred or disbursed. This value is displayed if you used the **Shift-F4** keys to access this screen.
Select TO Account = The account to which funds are being transferred. This value is displayed if you used the **Shift-F5** keys to access this screen.

Field Length: System-protected
Column Name: Not applicable

New

The following fields are used to add new customer accounts and to select an account number that is not in the account list.

Account Number — The application account number. When selecting a *from* account or *to* account, an account number other than one listed can be entered if allowed by the customer's financial institution. If an account number is entered to select an account, the Type field is required and the Qualifier field must be blank.

If a new customer account is being added, the account number must be entered.

Field Length: 1–19 numeric characters
Required Field: Yes, when adding a customer account.
Default Value: No default value
Column Name: Not applicable

Type — The account type name for this account. If an account type name value is entered in this field when selecting an account, the Account Number field is required and the Qualifier field must be blank. If a new customer account is being added, the account type name must be entered.

The reserved account type name values are as follows:

CD	= Certificate
CMRCL	= Commercial loan
CR	= Credit account
CR1	= Credit account
CR2	= Credit account
CR3	= Credit account
CR4	= Credit account
CR5	= Credit account
CR6	= Credit account
CR7	= Credit account
DDA	= Demand deposit account
DDA1	= Demand deposit account
DDA2	= Demand deposit account
DDA3	= Demand deposit account
DDA4	= Demand deposit account
DDA5	= Demand deposit account
DDA6	= Demand deposit account
DDA7	= Demand deposit account
DDA8	= Demand deposit account
INSTL	= Installment loan
IRA	= Retirement account
LOCR	= Line of credit
MRTGL	= Mortgage loan
NONE	= No account
NOW	= Interest-bearing checking account
SAV	= Savings account
SAV1	= Savings account
SAV2	= Savings account
SAV3	= Savings account

SAV4 = Savings account
SAV5 = Savings account
SAV6 = Savings account

Field Length: 1–6 alphanumeric characters
Required Field: Yes, when adding a customer account.
Default Value: No default value
Column Name: CACT.ACCT_TYP

Qualifier — A user-defined code that can be used in place of the account number and account type to identify this account.

Account qualifiers must be unique across all accounts assigned to the customer. For example, if the customer has two checking accounts, DDA and DDA1 can be used as qualifiers for the two accounts. The same account qualifier cannot be used for two different accounts.

If a qualifier value is entered in this field when selecting an account, the Account Number and Type fields must be blank. On all subsequent screens on which the account is used, the account qualifier is then displayed in place of the account number.

When adding a new customer account, a value can be entered in this field.

Field Length: 1–4 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: Not applicable

Allowed

The following three fields contain codes indicating whether the customer can perform specific types of transactions on this application account.

DB — A code indicating whether the customer can perform debit transactions on the account. Debit transactions include transfers and payments from this account. Valid values are as follows:

Y = Yes, allow debit transactions on the account.
N = No, do not allow debit transactions on the account.

Field Length: 1 alphanumeric character
Required Field: Yes, when adding a customer account.
Default Value: No default value
Column Name: CACT.ACT_ALWD_DB

CR — A code indicating whether the customer can perform credit transactions on the account. Credit transactions include transfers to this account. Valid values are as follows:

Y = Yes, allow credit transactions on the account.
N = No, do not allow credit transactions on the account.

Field Length: 1 alphanumeric character
Required Field: Yes, when adding a customer account.
Default Value: No default value
Column Name: CACT.ACT_ALWD_CR

INQ — A code indicating whether the customer can perform inquiry transactions (for example, available funds inquiry and scheduled transfers list inquiry) on the account. Valid values are as follows:

Y = Yes, allow inquiry transactions on the account.
N = No, do not allow inquiry transactions on the account.

Field Length: 1 alphanumeric character
Required Field: Yes, when adding a customer account.
Default Value: No default value
Column Name: CACT.ACT_ALWD_INQ

Description — A text description of the account.

Field Length: 1–15 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: CACT.DESCR

Account Number — An application account number defined to the system for this customer ID. This field cannot be changed when updating an account.

Field Length: 1–19 numeric characters
 Occurs: Up to four times
 Required Field: Yes, when selecting, updating, activating, deactivating, or deleting an account from the account list.
 Default Value: No default value
 Column Name: CACT.ACCT

Type — The account type name for this account. The account type name must already be defined to the system. This field cannot be changed when updating an account. The reserved account type name values are as follows:

CD = Certificate
 CMRCL = Commercial loan
 CR = Credit account
 CR1 = Credit account
 CR2 = Credit account
 CR3 = Credit account
 CR4 = Credit account
 CR5 = Credit account
 CR6 = Credit account
 CR7 = Credit account
 DDA = Demand deposit account
 DDA1 = Demand deposit account
 DDA2 = Demand deposit account
 DDA3 = Demand deposit account
 DDA4 = Demand deposit account
 DDA5 = Demand deposit account
 DDA6 = Demand deposit account
 DDA7 = Demand deposit account
 DDA8 = Demand deposit account
 INSTL = Installment loan
 IRA = Retirement account
 LOCR = Line of credit
 MRTGL = Mortgage loan
 NONE = No account
 NOW = Interest-bearing checking account
 SAV = Savings account
 SAV1 = Savings account
 SAV2 = Savings account
 SAV3 = Savings account
 SAV4 = Savings account
 SAV5 = Savings account
 SAV6 = Savings account

Field Length:	1–6 alphanumeric characters
Occurs:	Up to four times
Required Field:	Yes, when selecting, updating, activating, deactivating, or deleting an account from the account list.
Default Value:	No default value
Column Name:	CACT.ACCT_TYP

Qualifier — A user-defined code that can be used in place of the account number and account type to identify and access this account. This field can be changed when updating an account.

Account qualifiers must be unique across all accounts assigned to the customer. For example, if the customer has two checking accounts, DDA and DDA1 can be used as qualifiers for the two accounts. The same account qualifier cannot be used for two different accounts.

Examples:	DDA DDA1 SAV1
Field Length:	1–4 alphanumeric characters
Occurs:	Up to four times
Required Field:	No
Default Value:	No default value
Column Name:	CACT.ACCT_QUAL

Allowed

The following fields contain codes indicating whether the customer can perform specific types of transactions on this application account.

DB — A code indicating whether the customer can perform debit transactions on the account. Debit transactions include transfers and payments from this account. This field can be changed when updating an account. Valid values are as follows:

Y = Yes, allow debit transactions.
N = No, do not allow debit transactions.

Field Length: 1 alphabetic character
Occurs: Up to four times
Required Field: Yes, when selecting, updating, activating, deactivating, or deleting an account from the account list.
Default Value: No default value
Column Name: CACT.ACT_ALWD_DB

CR — A code indicating whether the customer can perform credit transactions on the account. Credit transactions include transfers to this account. This field can be changed when updating an account. Valid values are as follows:

Y = Yes, allow credit transactions.

N = No, do not allow credit transactions.

Field Length: 1 alphabetic character
Occurs: Up to four times
Required Field: Yes, when selecting, updating, activating, deactivating, or deleting an account from the account list.
Default Value: No default value
Column Name: CACT.ACT_ALWD_CR

INQ — A code indicating whether the customer can perform inquiry transactions (for example, balance inquiry and scheduled transfer inquiry) on the account. This field can be changed when updating an account. Valid values are as follows:

Y = Yes, allow inquiry transactions.

N = No, do not allow inquiry transactions.

Field Length: 1 alphabetic character
Occurs: Up to four times
Required Field: Yes, when selecting, updating, activating, deactivating, or deleting an account from the account list.
Default Value: No default value
Column Name: CACT.ACT_ALWD_INQ

Status — The current status of the account indicating the action to be taken by the Integrated Authorization Server process if this account status is encountered during transaction processing. Valid status codes and the actions taken for each code are provided in the following table.

Status Code	Action
CLOSED	Deny transactions.
DEPONLY	Accept all transactions except transfers from this account.
INACTV	Deny transactions.
OPEN	Accept transactions.
OPENPRI	Accept transactions.
RSTDPRI	Accept all transactions except transfers from this account.

Field Length: System-protected

Occurs: Up to four times

Column Name: CACT.STAT

Begin — The date on which this account will become available for use in transaction processing.

The format in which the date in this field is displayed (for example, YYYYMMDD) is provided immediately below the Begin field caption on the screen.

Field Length: System-protected

Occurs: Up to four times

Column Name: CACT.BEG_DAT

End — The date on which this account will no longer be available for use in transaction processing. If this field is blank, the account does not expire.

The format in which the date in this field is displayed (for example, YYYYMMDD) is provided immediately below the End field caption on the screen.

Field Length: System-protected
Occurs: Up to four times
Column Name: CACT.END_DAT

Description — A text description of the account. This field can be changed when updating an account.

Field Length: 1–15 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: CACT.DESCR

FIID — The account is associated with this financial institution identifier (FIID).

Field Length: System-protected
Occurs: Up to four times
Column Name: CACT.FIID

ACI Worldwide Inc.

Section 13

Customer Information

The Customer Information screen is a BASE24-billpay screen that allows you to review and update customer information as well as deactivate customer IDs. Screen 1 displays personal information for the customer as well as the customer verification status and availability dates for the customer's ID. Screen 2 displays the default and service fee account numbers for the customer as well as the current processing parameters.

You can access this screen by selecting either the customer information inquiry (for example, CUSTOMER INFO INQ) or customer information change (for example, CUSTOMER INFO CHANGE) transactions from the Transaction Menu. The information retrieved during verification processing for the current customer is used to automatically retrieve and display the customer information when you first enter the screen.

The customer verification status for a customer's ID must be set to any value other than ISSUED to be able to access the customer's information on this screen. If the customer verification status is set to a value of ISSUED, you can access the customer's information using the Customer Signup screen only.

The Customer Information screen allows you to update personal customer information as well as the default account number and type, service fee account number and type, and profile defined for BASE24-billpay customers.

Deactivating a customer ID changes the end date for the customer ID to the current system date minus one day and sets the customer verification status to a value of CLOSED. Once a customer ID is deactivated, it can no longer be used in processing. If the customer ID to be deactivated has any pending scheduled payments or transfers, these must be deleted before the customer ID can be deactivated. Data for deactivated customer IDs is retained in the system for a configurable period of time before it is removed. Deactivated customer IDs can be reactivated only by service provider or financial institution back-office personnel using the appropriate BASE24-telebanking table maintenance screens.

From the Customer Information screen, you can access several screens or request a Customer Vendor List to be printed and sent to the customer by pressing the appropriate function key.

Screen 1 Function Keys

The use of two function keys on Customer Information screen 1 differs from that specified for the standard CSR function keys explained in section 1. The use of these function keys is explained below.

The first column of information below shows the BASE24 keys. The second column describes the functions that can be accomplished with these function keys.

Key	Description
F13	Display Customer Account List — Displays the Customer Account List screen.
F14	Display Miscellaneous Request — Displays the Miscellaneous Request screen.
Shift-F4	Scheduled Transactions — Displays the Scheduled Transactions (Payments and Transfers) screen.
Shift-F5	Branches — Displays the Branch List screen.

Screen 1

Customer Information screen 1 allows you to view and update current customer information about a customer ID as well as deactivate a customer ID. Customer Information screen 1 is shown below, followed by descriptions of its fields.

BANK — The name of the customer's financial institution. The value in this field was retrieved during customer verification processing.

Field Length: System-protected
Column Name: BANK.BANK_NAME

CUSTOMER ID — The unique identification number assigned to the customer. The value in this field was retrieved during customer verification processing.

Field Length: System-protected
Column Name: CSTT.PAN

ACCT NUMBER — An application account number for this customer. An account number is displayed in this field only if one was entered and retrieved during customer verification processing. Otherwise, this field is blank.

Field Length: System-protected
Column Name: CACT.ACCT

NAME — The customer's family name or last name, followed by the customer's given name or first name, and the customer's middle initial. The name displayed in these fields was retrieved during customer verification processing.

Field Length: System-protected
Column Names: PIT.NAM_FMLY
PIT.NAM_GIVEN
PIT.NAM_M_I

Address

The following seven fields contain the customer's street or mailing address.

L1 — The first line of the street or mailing address for this customer.

Field Length: 1–30 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: PIT.STR_ADDR_1

L2 — The second line of the street or mailing address for this customer.

Field Length: 1–30 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: PIT.STR_ADDR_2

L3 — The third line of the street or mailing address for this customer.

Field Length: 1–30 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: PIT.STR_ADDR_3

City — The name of the city for this customer’s residence or mailing address.

Field Length: 1–25 alphanumeric characters
Required Field: Yes
Default Value: No default value
Column Name: PIT.CITY

ST — The two-letter U.S. state or Canadian province abbreviation for this customer’s residence or mailing address. Reserved state codes are defined in the 1988 ANSI X3.38 standard, *Identification of the States, the District of Columbia, and the Outlying and Associated Areas of the United States for Information Interchange*.

Field Length: 2 alphanumeric characters
Required Field: Yes
Default Value: No default value
Column Name: PIT.ST_CDE

Postal Code — The postal code of this customer’s residence or mailing address.

Field Length: 1–10 alphanumeric characters
Required Field: Yes
Default Value: No default value
Column Name: PIT.POSTAL_CDE

Country — The country code associated with this customer’s residence or mailing address. Reserved country code values are defined in the 1993 ISO 3166 standard, *Codes for the Representation of Names of Countries*.

Field Length: 3 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: PIT.CNTRY_CDE

Customer Verify Status — A code identifying the verification status of the customer's ID. Valid values are as follows:

ISSUED = Issued but inactive
VERIFIED = Verified
CLOSED = Closed
USER-DFN = User-defined

A customer ID cannot be used in transaction processing unless this field is set to a value of VERIFIED.

Field Length: System-protected
Column Name: CSTT.VRFY_FLG

Last Change — The date on which the Customer Verify Status field was last updated.

The format (for example, YYYYMMDD) in which the date in this field is displayed is provided immediately below the End Date field value on the screen.

Field Length: System-protected
Column Name: CSTT.LAST_VRFY_FLG_UPDT_TS

Start Date — The date on which the customer's ID will become available for use in transaction processing. The date displayed in this field is set when the customer is signed up for BASE24-billpay service.

The format (for example, YYYYMMDD) in which the date in this field is displayed is provided immediately below the End Date field value on the screen.

Field Length: System-protected
Column Name: CSTT.BEG_DAT

End Date — The date on which the customer's ID will no longer be available for use in transaction processing. If this field is blank, no expiration date is used. The date in this field is set when the customer is signed up for BASE24-billpay service.

The format (for example, YYYYMMDD) in which the date in this field is displayed is provided immediately below the End Date field value on the screen.

Field Length: System-protected
Column Name: CSTT.END_DAT

Phone

The following six fields contain phone numbers that can be used to reach this customer.

Home — The home telephone number for this customer.

Field Length: 1–20 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: PIT.PHN_HOME

Work — The work telephone number for this customer.

Field Length: 1–20 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: PIT.PHN_WRK

<phn1desc> — The description (for example, CELL#, PAGE#, FAX#) of the telephone number provided in the <Othrphn1> field.

If the <Othrphn1> field contains an entry, this field must contain an entry.

Field Length: 1–10 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: PIT.PHN_OTHER_1_DESCR

<othrphn1> — Another telephone number (for example, a cellular, pager, or fax number) that can be used to reach this customer.

If the <Phn1desc> field contains an entry, this field must contain an entry.

Field Length: 1–20 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: PIT.PHN_OTHER_1

<phn2desc> — The description (for example, CELL#, PAGE#, FAX#) of the telephone number provided in the <Othrphn2> field.

If the <Othrphn2> field contains an entry, this field must contain an entry.

Field Length: 1–10 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: PIT.PHN_OTHER_2_DESCR

<othrphn2> — Another telephone number (for example, a cellular, pager, or fax number) that can be used to reach this customer.

If the <Phn2desc> field contains an entry, this field must contain an entry.

Field Length: 1–20 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: PIT.PHN_OTHER_2

Customer Information

The following three fields contain user-defined information configured for this customer. This information is displayed on the Customer Verify Response screen and can be used for customer verification purposes, especially if the Customer Personal Detail screen is not used. For example, these fields could be used to contain the customer's government ID, birth date, and mother's maiden name.

C1 — The first line of user-defined customer information.

Field Length: 1–20 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: CSTT.CUST_INFO_1

C2 — The second line of user-defined customer information.

Field Length: 1–20 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: CSTT.CUST_INFO_2

C3 — The third line of user-defined customer information.

Field Length: 1–20 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: CSTT.CUST_INFO_3

Birth Date — The birth date of this customer.

The format (for example, YYYYMMDD) in which the date in this field is entered and displayed is provided immediately to the right of the Birth Date field value on the screen.

Field Length: 8 numeric characters
Required Field: No
Default Value: No default value
Column Name: PIT.BIRTH_DAT

Mother's Maiden Name — The maiden name of this customer's mother. This name can be used to verify the identity of this customer.

This field accepts special characters required for languages other than U.S. English.

Field Length: 1–20 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: PIT.MTHR_MDN_NAM

Customer Type — A code indicating whether this customer is a business or an individual. This is an information-only field and is not used in processing.

Reserved values are as follows:

BØ = Business customer

CØ = Individual customer

This field may also contain a user-defined customer type code.

Field Length: 1–2 alphanumeric characters

Required Field: Yes

Default Value: CØ

Column Name: CSTT.TYP

Screen 2 Function Keys

The use of two function keys on Customer Information screen 2 differs from that specified for the standard CSR function keys explained in section 1. The use of these function keys is explained below.

The first column of information below shows the BASE24 keys. The second column describes the functions that can be accomplished with these function keys.

Key	Description
F13	Display Customer Account List — Displays the Customer Account List screen.
F14	Display Miscellaneous Request — Displays the Miscellaneous Request screen.
Shift-F4	Scheduled Transactions — Displays the Scheduled Transactions (Payments and Transfers) screen.
Shift-F5	Branches — Displays the Branch List screen.

Screen 2

Customer Information screen 2 allows you to view and update the default and service fee accounts and profile for a customer as well as obtain current processing information for the customer. Customer Information screen 2 is shown below, followed by descriptions of its fields.

Default

The following two fields define the default account number for this customer.

Account Number — The number of the account for which balance information is returned to this customer with approved PIN verify transactions. If this field contains a value, the Type field must also contain a value.

Field Length:1–19 numeric characters

Required Field:No

Default Value:No default value

Column Name:CSTT.DFLT_ACCT

Type — The account type associated with the default account number for which balance information is returned to this customer with PIN verify transactions. If the code entered in this field is not already defined to the system, this field will display the value UNKNWN. If this field contains a value, the Account Number field must also contain a value.

Field Length: 1–6 alphanumeric characters
Required Field: Yes
Default Value: No default value
Column Name: CSTT.DFLT_ACCT_TYP

Svc Fee

The following two fields define the service fee account number for this customer.

Account Number — The account number charged by the customer's financial institution using the automatic debit feature for BASE24-billpay service. The Type field indicates the type of account associated with this account number. Use of this field is optional. If this field contains a value, the Type field must also contain a value.

Field Length: 1–19 numeric characters
Required Field: No
Default Value: No default value
Column Name: CSTT.SVC_FEE_ACCT

Type — The account type associated with the service fee account number for this customer. This field identifies the type of account charged by the customer's financial institution using the automatic debit feature for the billpay service. Use of this field is optional. If the Account Number field contains a value, this field must also contain a value. If the code entered in this field is not already defined to the system, this field will display the value UNKNWN.

Field Length: 1–6 alphanumeric characters
Required Field: Yes, if the Account Number field contains a value
Default Value: No default value
Column Name: CSTT.SVC_FEE_ACCT_TYP

Branch — The identifier for the main branch of the financial institution providing service to this BASE24-billpay customer.

Although this field is system-protected, you can still alter its value by selecting a different branch from the Branch List screen and then updating the customer information before exiting the screen. You can access the Branch List screen using the **Shift-F5** keys and update the customer information using the **F8** key.

Field Length: System-protected
Column Name: CSTT.BRCH_ID

Max Online History Records — The maximum number of transaction items that this customer can request in a history inquiry or last payments/transfers inquiry transaction from a remote banking device. This field specifies the total number of items that can be returned for the transaction, not just for each response message included in the transaction. This field does not limit the number of items you can request in a history inquiry or last payments/transfers inquiry transaction on behalf of the customer. Valid values are as follows:

0 = No maximum is enforced
1–9999 = Maximum number of transaction items that can be returned

Field Length: System-protected
Column Name: CSTT.MAX_HIST_RECS

Billpay Tran Limit — The maximum amount the customer can request in an individual BASE24-billpay payment transaction. If a requested amount is greater than this limit, the transaction is denied. If this field is set to 0, the payment high limit defined for the customer's financial institution controls the maximum amount of any payment transactions for this customer.

Field Length: System-protected
Column Name: CSTT.BP_TXN_LMT

Billing Type

The following three fields define the current and original billing type for this customer.

Current — The current billing type assigned to this customer for billing purposes. The billing type defines the service level and fee structure for BASE24-billpay service. Any alphanumeric values are supported and all values are user-defined.

Field Length: System-protected
Column Name: CBPT.CUR_BILL_TYP

Last Change — The date that the original billing type (Original field) was last updated.

The format (for example, YYYYMMDD) in which the date in this field is displayed is displayed immediately below the value of the Last Change field on the screen.

Field Length: System-protected
Column Name: CSTT.LAST_BP_BILL_TYP_UPDT_TS

Original — The original billing type assigned to this customer. The billing type defines the service level and fee structure for the billpay service. Any alphanumeric values are supported and all values are user-defined.

Field Length: System-protected
Column Name: CBPT.ORIG_BILL_TYP

Profile — A code used to group the services (that is, allowed transactions) available for the customer's ID. A customer profile allows you to associate customers with a particular level of service.

The value you enter in this field must first be defined to the system by back-office personnel.

Note: If you change the value of this field to a profile that does not allow customer information change transactions, you will no longer be able to update any customer information for this customer ID.

Field Length: 1–8 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: CSTT.PRFL

Alternate Contact — The name of an alternate contact person for this customer.

Field Length: 1–30 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: CSTT.ALT_CONTACT

Government ID — A code used as a government identifier. This is normally a tax ID number or a U.S. social security number.

Field Length: 1–15 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: PIT.GOV_T_ID

Title — A title used to address this customer.

Field Length: 1–6 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: PIT.TITLE

Language — A user-defined code indicating the primary language spoken by this customer. Valid values are 00–99.

Field Length: 2 numeric characters
Required Field: No
Default Value: 00
Column Name: PIT.LANG_IND

Screen 3 Function Keys

The use of two function keys on Customer Information screen 2 differs from that specified for the standard CSR function keys explained in section 1. The use of these function keys is explained below.

The first column of information below shows the BASE24 keys. The second column describes the functions that can be accomplished with these function keys.

Key	Description
F13	Display Customer Account List — Displays the Customer Account List screen.
F14	Display Miscellaneous Request — Displays the Miscellaneous Request screen.
Shift-F4	Scheduled Transactions — Displays the Scheduled Transactions (Payments and Transfers) screen.
Shift-F5	Branches — Displays the Branch List screen.

Screen 3

Customer Information screen 3 allows you to view and update the default and service fee accounts and profile for a customer as well as obtain current processing information for the customer. Customer Information screen 3 is shown below, followed by descriptions of its fields.

Billing Group — The billing group to which this customer currently belongs. If the BASE24-billpay Billing Application is not being used, this field may be blank.

Field Length: System-protected
Column Name: CBPT.BILL_GRP

Last Cycle End Date — The end date of the last billing cycle for this customer. The date is displayed in the format YYYYMMDD. If the BASE24-billpay Billing Application is not being used, this field can be blank.

Field Length: System-protected
Column Name: CBPT.LAST_CYCLE_END_DATE

Number Cycles Processed — The number of billing cycles that have been processed for the current billing type. If the BASE24-billpay Billing Application is not being used, this field may be blank.

Field Length: System-protected
Column Name: CBPT.NUM_CYCLES

Last Customer/Vendor Number Assigned — The last customer vendor number used for this customer. The next vendor number for this customer is the value in this field plus 1.

Field Length: System-protected
Column Name: CBPT.LAST_CUST_VEND_NUM

Next Tran Reference Number to be Used — The reference number to use for this customer's next billpay transaction. The Billpay Server process and the Scheduled Transaction Initiator process manage the value in this field.

Field Length: System-protected
Column Name: CBPT.NEXT_REF_NUM

Packet Status — A user-defined code dictating whether an informational packet explaining the billpay service has been sent for this customer ID. Any alphanumeric value is supported and all values are user-defined.

Field Length: System-protected
Column Name: CSTT.PCKT_STAT

Last Change — The date that the packet status field was updated.

Field Length: System-protected
Column Name: CSTT.LAST_PCKT_STAT_UPDT_TS

Section 14

Customer Personal Detail

The Customer Personal Detail screen is a BASE24-telebanking screen that displays detailed personal information configured to the system for a customer and enables you to authenticate the customer by asking the customer to provide certain personal information details. The exact information to request from the customer is determined by your organization. Your supervisor should provide you with instructions for the exact information to request. This screen is displayed when you press the **F5** key on the Customer Verify Response screen.

The Customer Personal Detail screen is used by both the BASE24-billpay and BASE24-telebanking products when detailed personal information is required to verify the identity of the customer.

From this screen, you can also verify or change the customer's personal identification number (PIN), change customers, or access the Transaction Menu by pressing the appropriate function key.

Screen 1 Function Keys

The use of three function keys on Customer Personal Detail screen 1 differs from that specified for the standard CSR function keys explained in section 1. The use of these function keys is explained below.

The first column of information below shows the BASE24 keys. The second column describes the functions that can be accomplished with these function keys.

Key	Description
F3	PIN Verify — Displays Authorization Request screen 1 (PIN verify). This screen enables you to enter and authorize a customer's personal identification number (PIN). Note: If you attempt to verify the customer's PIN and a PIN change is required, Authorization Request screen 1 (PIN change) is displayed instead. The PIN change transaction takes priority over the PIN verify transaction.
F4	Transaction Menu — Displays the Transaction Menu. Note: If you attempt to access this menu without first verifying or changing the customer's PIN when required, the appropriate Authorization Request screen 1 (PIN change or PIN verify) is displayed instead.
F6	Pin Change — Displays Authorization Request screen 1 (PIN change). This screen enables you to enter a new personal identification number (PIN) on behalf of the customer.

Screen 1

Customer Personal Detail screen 1 defines personal information that can be used to authenticate a customer. Customer Personal Detail screen 1 is shown below, followed by descriptions of its fields.

CUSTOMER ID — The unique identification number assigned to the customer. The value in this field was retrieved during customer verification processing.

Field Length: System-protected
Column Name: CSTT.PAN

ACCT NUMBER — An application account number for this customer. An account number is displayed in this field only if one was entered and retrieved during customer verification processing. Otherwise, this field is blank.

Field Length: System-protected
Column Name: CACT.ACCT

NAME — The customer's family name or last name, followed by the customer's given name or first name, and the customer's middle initial. The name displayed in these fields was retrieved during customer verification processing.

Field Length: System-protected
Column Names: PIT.NAM_FMLY
PIT.NAM_GIVEN
PIT.NAM_M_I

PERSONAL ID — The identifier for this customer's personal information. The identifier can be prescribed by the service provider, chosen by the customer, or generated by the system, and must be unique within the system. For example, this field could contain an employee number for a business customer. For an individual customer, this field could contain the individual's social security number or the customer ID.

When a new customer is added using the Customer Signup screen, the personal ID is always set to the value of the customer ID.

Field Length: System-protected
Column Name: PIT.PRSNL_ID

MIDDLE INITIAL — The initial of this customer's middle name.

Field Length: System-protected
Column Name: PIT.NAM_M_I

Field Length: System-protected
Column Name: PIT.PHN_HOME

WORK PHONE — The work telephone number for this customer.

Field Length: System-protected
Column Name: PIT.PHN_WRK

OTHER PHONE — Any other telephone number (for example, a cellular, pager, or fax number) that can be used to reach this customer. The DESCR field on the same line of the screen describes this phone number.

Field Length: System-protected
Column Name: PIT.PHN_OTHER_1

DESCR — A description (for example, CELL#, PAGE#, or FAX#) of the telephone number provided in the OTHER PHONE field on the same line of the screen.

Field Length: System-protected
Column Name: PIT.PHN_OTHER_1_DESCR

OTHER PHONE — Any other telephone number (for example, a cellular, pager, or fax number) that can be used to reach this customer. The DESCR field on the same line of the screen describes this phone number.

Field Length: System-protected
Column Name: PIT.PHN_OTHER_2

DESCR — A description (for example, CELL#, PAGE#, or FAX#) of the telephone number provided in the OTHER PHONE field on the same line of the screen.

Field Length: System-protected
Column Name: PIT.PHN_OTHER_2_DESCR

BIRTH DATE — The birth date, in YYYYMMDD format, of this customer.

Field Length: System-protected

Column Name: PIT.DOB

GOVERNMENT ID — The government ID (for example, U.S. social security number) assigned to this customer.

Field Length: System-protected

Column Name: PIT.GOVТ_ID

LANGUAGE IND — A user-defined code indicating the primary language spoken by this customer. Valid values are 00–99.

Field Length: System-protected

Column Name: PIT.LANG_IND

MOTHER’S MAIDEN NAME — The maiden name of this customer’s mother.

This field displays special characters required for languages other than U.S. English.

Field Length: System-protected

Column Name: PIT.MTHR_MDN_NAM

ACI Worldwide Inc.

Section 15

Customer Signup

The Customer Signup screen is a BASE24-billpay screen that allows you to sign up new customers for BASE24-billpay service and activate customer IDs.

Customers are signed up in two ways, depending upon whether the financial institution managing the customers uses preloaded customer data.

If the customer's financial institution uses preloaded customer data, you must enter a customer ID and verify the customer before you can access the Customer Signup screen. When the Customer Signup screen is accessed, data will be displayed in all required fields. If the Customer Verify Status field was set to any value other than ISSUED when the customer data was loaded, the customer's ID is already considered to be activated and access to the Customer Signup screen is not allowed. If the Customer Verify Status field was set to a value of ISSUED when the customer data was loaded, you can access the Customer Signup screen. You can then review the customer information, update it if required (for example, if the customer has changed addresses), and activate BASE24-billpay service for the customer's ID by pressing **F8** key, if your organization allows you to do so (see the note below).

If the customer's financial institution does not use preloaded customer data, you can access the Customer Signup screen without entering a customer ID during customer verification. You need only enter the customer name. When the Customer Signup screen is displayed, default data or no data will be displayed in screen fields. You must then obtain all required information from the customer and enter it on the screen. After all required data is entered, you can press the **F14** key to add the data to the appropriate database tables. Once the data is entered, it should be verified according to the policies of the customer's financial institution or the service provider. After it has been verified, you can activate BASE24-billpay service for the customer's ID by pressing another function key.

Note: Depending upon the policies of your organization, you may or may not be allowed to verify customer information and activate customer IDs. If you are not, customer information is typically verified and activated by back-office personnel after you have added the customer information.

Refer to section 3 of this manual for detailed instructions on signing up customers with or without preloaded customer data.

The Customer Signup screens can be accessed either by selecting the Customer Signup (CUSTOMER SIGN-UP) transaction from the Transaction Menu or by pressing the **F8** key on the Customer Verify screen. If you attempt to access the Customer Signup screens without the BANK field filled in from the Customer Verify Request screen, the Bank List screen is displayed. You must select a financial institution from this screen using the **F1** key before the Customer Signup screen is displayed.

From the Customer Signup screen, you can access several screens by pressing the appropriate function key.

Default Data

If you are signing up a new customer whose financial institution does not use preloaded customer data, default data from the following tables can be displayed in many of the fields on the screen:

- Customer Table (CSTT)
- Customer/Account Relation Table (CACT)
- Customer/Personal ID Relation Table (CPIT)
- Personal Information Table (PIT)

ACI provides default rows for these tables when your BASE24-billpay system is installed. Refer to the ***BASE24 Core Files and Tables Maintenance Manual*** for descriptions of this default data.

Screen 1 Function Keys

The use of three function keys on Customer Signup screen 1 differs from that specified for the standard CSR function keys explained in section 1. The use of these function keys is explained below.

The first column of information below shows the BASE24 keys. The second column describes the functions that can be accomplished with these function keys.

Key	Description
F13	Signup Accounts — Displays Customer Signup Accounts screen 1. This screen allows you to enter individual application accounts for the new customer. If the customer's financial institution uses preloaded customer data, use of this screen is not allowed.
Shift-F5	Branches — Displays Branch List screen 1 from which you can choose an individual main branch for the customer's financial institution.
Shift-F6	Banks — Displays Bank List screen 1 from which you can choose an individual financial institution. You cannot use these function keys after the customer's ID has been added.

When the customer ID is added or generated, the personal ID associated with the customer's personal information in the Personal Information Table (PIT) is automatically set to the same value as the customer ID.

Note: If customer IDs are generated by the system, this field will display "SYSTEM GENERATED" in this field when you access the screen. If you must enter a customer ID, this field will be blank when you access the screen.

Field Length: System-protected, if accessing for a customer whose data was preloaded or if customer IDs are system generated.
1–19 numeric characters, if you must enter customer IDs.

Required Field: Yes

Default Value: No default value

Column Name: CSTT.PAN

ACCT NUMBER — An application account number for this customer. An account number is displayed in this field only if one was entered and retrieved during customer verification processing. Otherwise, this field is blank.

Field Length: System-protected

Column Name: CACT.ACCT

NAME — The customer's family name or last name, followed by the customer's given name or first name, and the customer's middle initial. The name displayed in these fields was retrieved during customer verification processing.

These fields accept special characters required for languages other than U.S. English.

Field Length: 1–20 alphanumeric characters (family name)
1–10 alphanumeric characters (given name)
1 alphanumeric character (middle initial)

Required Field: Yes

Default Value: No default value

Column Names: PIT.NAM_FMLY
PIT.NAM_GIVEN
PIT.NAM_M_I

Address

The following seven fields contain the customer's street or mailing address.

L1 — The first line of the street or mailing address for this customer.

Field Length: 1–30 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: PIT.STR_ADDR_1

L2 — The second line of the street or mailing address for this customer.

Field Length: 1–30 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: PIT.STR_ADDR_2

L3 — The third line of the street or mailing address for this customer.

Field Length: 1–30 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: PIT.STR_ADDR_3

City — The name of the city for this customer's residence or mailing address.

Field Length: 1–25 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: PIT.CITY

ST — The two-letter U.S. state or Canadian province abbreviation for this customer's residence or mailing address. Reserved state codes are defined in the 1988 ANSI X3.38 standard, *Identification of the States, the District of Columbia, and the Outlying and Associated Areas of the United States for Information Interchange*.

Field Length: 2 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: PIT.ST_CDE

Postal Code — The postal code of this customer's residence or mailing address.

Field Length: 1–10 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: PIT.POSTAL_CDE

Country — The country code associated with this customer's residence or mailing address. Reserved country code values are defined in the 1993 ISO 3166 standard, *Codes for the Representation of Names of Countries*.

Field Length: 3 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: PIT.CNTRY_CDE

Customer Verify Status — A code identifying the verification status of the customer's ID. Valid values are as follows:

ISSUED = Issued but inactive
VERIFIED = Verified
CLOSED = Closed
USER-DFN = User-defined

A customer ID cannot be used in transaction processing unless this field displays a value of VERIFIED.

The value of this field is automatically changed to VERIFIED when you press the **F15** key to activate the customer's ID.

Field Length: System-protected
Column Name: CSTT.VRFY_FLG

Last Change — The date on which the Customer Verify Status field was last updated for this customer.

The format (for example, YYYYMMDD) in which the date in this field is displayed is provided immediately below the End Date field value on the screen.

Field Length: System-protected
Column Name: CSTT.LAST_VRFY_FLG_UPDT_TS

Start Date — The date on which this customer ID will become available for use in transaction processing.

This field, along with the End Date field, allows users to predefine customer information prior to the customer's actual implementation of service. These fields could also be used to define a trial or contracted usage period for a customer.

The format (for example, YYYYMMDD) in which the date in this field is displayed is provided immediately below the End Date field value on the screen.

Field Length: System-protected
Column Name: CSTT.BEG_DAT

End Date — The date on which this customer ID will no longer be available for use in transaction processing. If this field is blank, no expiration date is set.

This field, along with the Start Date field, allows users to predefine customer information prior to the customer's actual implementation of service. These fields could also be used to define a trial or contracted usage period for a customer.

The format (for example, YYYYMMDD) in which the date in this field is displayed is provided immediately below the End Date field value on the screen.

Field Length: System-protected
Column Name: CSTT.END_DAT

Phone

The following six fields contain phone numbers that can be used to reach this customer.

Home — The home telephone number for this customer.

Field Length: 1–20 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: PIT.PHN_HOME

Work — The work telephone number for this customer.

Field Length: 1–20 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: PIT.PHN_WRK

<Phn1desc> — A description (for example, CELL#, PAGE#, FAX#) of the telephone number provided in the <Othrphn1> field.

If you enter a value in this field, you must also enter a value in the <Othrphn1> field.

Field Length: 1–10 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: PIT.PHN_OTHER_1_DESCR

<Othrphn1> — Another telephone number (for example, a cellular, pager, or fax number) that can be used to reach this customer.

If you enter a value in this field, you must also enter a value in the <Phn1desc> field.

Field Length: 1–20 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: PIT.PHN_OTHER_1

<Phn2desc> — A description (for example, CELL#, PAGE#, FAX#) of the telephone number provided in the <Othrphn2> field.

If you enter a value in this field, you must also enter a value in the <Othrphn2> field.

Field Length: 1–10 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: PIT.PHN_OTHER_2_DESCR

<Othrphn2> — Another telephone number (for example, a cellular, pager, or fax number) that can be used to reach this customer.

If you enter a value in this field, you must also enter a value in the <Phn2desc> field.

Field Length: 1–20 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: PIT.PHN_OTHER_2

Customer Information

The following three fields contain user-defined information for this customer. This information is displayed on the Customer Verify Response screen and can be used for customer verification purposes, especially if the Customer Personal Detail screen is not used. For example, these fields could be used to contain the customer's government ID, birth date, and mother's maiden name.

C1 — The first line of user-defined customer information.

Field Length: 1–20 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: CSTT.CUST_INFO_1

C2 — The second line of user-defined customer information.

Field Length: 1–20 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: CSTT.CUST_INFO_2

C3 — The third line of user-defined customer information.

Field Length: 1–20 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: CSTT.CUST_INFO_3

Birth Date — The birth date of this customer.

The format (for example, YYYYMMDD) in which the date in this field is entered and displayed is provided immediately to the right of the Birth Date field value on the screen.

Field Length: 8 numeric characters
Required Field: No
Default Value: No default value
Column Name: PIT.BIRTH_DAT

Mother's Maiden Name — The maiden name of this customer's mother. This name can be used to verify the identity of this customer.

This field accepts special characters required for languages other than U.S. English.

Field Length: 1–20 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: PIT.MTHR_MDN_NAM

Customer Type — A code indicating whether this customer is a business or an individual. This is an information-only field that is not used in processing.

Reserved values are as follows:

Bb = Business customer

Cb = Individual customer

This field may also contain a user-defined customer type code.

Field Length: 1–2 alphanumeric characters

Required Field: Yes

Default Value: Cb

Column Name: CSTT.TYP

Screen 2 Function Keys

The use of three function keys on Customer Signup screen 2 differs from that specified for the standard CSR function keys explained in section 1. The use of these function keys is explained below.

The first column of information below shows the BASE24 keys. The second column describes the functions that can be accomplished with these function keys.

Key	Description
F13	Signup Accounts — Displays Customer Signup Accounts screen 1. This screen allows you to enter individual application accounts for the new customer. If the customer's financial institution uses preloaded customer data, use of this screen is not allowed.
Shift-F5	Branches — Displays Branch List screen 1 from which you can choose an individual main branch for the customer's financial institution.
Shift-F6	Banks — Displays Bank List screen 1 from which you can choose an individual financial institution. You cannot use these function keys after the customer's ID has been added.

Screen 2

Customer Signup screen 2 allows you to enter processing information about a BASE24-billpay customer ID. Customer Signup screen 2 is shown below, followed by descriptions of its fields.

BASE24-CORE CUSTOMER SIGNUP LLLL FIID YY/MM/DD hh:mm 2 OF 3

F11-PrevPageF15-ActivateF16-Return

Default

The following two fields define the default account number for this customer

Account Number — The number of the account for which balance information is returned to this customer with PIN verify transactions. If this field contains a value, the Type field must also contain a value.

Field Length:1–19 numeric characters

Required Field:No

Default Value:No default value

Column Name:CSTT.DFLT_ACCT

Type — An account type associated with the default account number for which balance information is returned to this customer with PIN verify transactions. If the code entered in this field is not already defined to the system, this field will display the value UNKNWN. If the Account Number field contains a value, this field must also contain a value.

Field Length: 1–6 alphanumeric characters
Required Field: Yes, if the Account Number field contains a value
Default Value: No default value
Column Name: CSTT.DFLT_ACCT_TYP

Svc Fee

The following two fields define the service fee account number for this customer

Account Number — The account number charged by the customer's financial institution using the automatic debit feature for BASE24-billpay service. The Type field indicates the type of account associated with this account number. Use of this field is optional. If the Type field contains a value, this field must also contain a value.

Field Length: 1–19 numeric characters
Required Field: Yes, if the Type field contains a value
Default Value: No default value
Column Name: CSTT.SVC_FEE_ACCT

Type — The account type associated with the service fee account number for this customer. This field identifies the type of account charged by the customer's financial institution using the automatic debit feature for BASE24-billpay service. Use of this field is optional. If the Account Number field contains a value, this field must also contain a value. If the code entered in this field is not already defined to the system, this field will display the value UNKNWN.

Field Length: 1–6 alphanumeric characters
Required Field: Yes, if the Account Number field contains a value
Default Value: No default value
Column Name: CSTT.SVC_FEE_ACCT_TYP

Branch — The identifier for the main branch of the financial institution providing BASE24-billpay service to this customer.

Although this field is system-protected, you can still change its value by selecting a different branch from the Branch List screen and then updating the customer information before exiting the screen. You can access the Branch List screen using the **Shift-F5** keys and update the customer information using the **F8** key.

Field Length: System-protected
Column Name: CSTT.BRCH_ID

Max Online History Records — The maximum number of transaction items that this customer can request in a history inquiry or last payments/transfers inquiry transaction from a remote banking device. This field specifies the total number of items that can be returned for the transaction, not just for each response message included in the transaction. This field does not limit the number of items you can request in a history inquiry or last payments/transfers inquiry transaction on behalf of the customer. Valid values are as follows:

0 = No maximum is enforced.
1–9999 = Maximum number of transaction items that can be returned.

Field Length: System-protected
Column Name: CSTT.MAX_HIST_RECS

Billpay Tran Limit — The maximum amount the customer can request in an individual BASE24-billpay payment transaction. If a requested amount is greater than this limit, the transaction is denied. If this field is set to 0, the payment high limit defined for the customer's financial institution controls the maximum amount of any payment transactions for this customer.

Field Length: System-protected
Column Name: CSTT.BP_TXN_LMT

Billing Type

The following three fields define the current and original billing type for this customer.

Current — The current billing type assigned to this customer for billing purposes. The billing type defines the service level and fee structure for BASE24-billpay service. Any alphanumeric values are supported and all values are user defined.

Field Length: System-protected
Column Name: CBPT.CUR_BILL_TYP

Last Change — The date that the original billing type (Original field) was last updated.

The format (for example, YYYYMMDD) in which the date in this field is displayed is provided immediately below the Last Change field value on the screen.

Field Length: System-protected
Column Name: CSTT.LAST_BP_BILL_TYP_UPDT_TS

Original — The original billing type assigned to this customer. The billing type defines the service level and fee structure for BASE24-billpay service. Any alphanumeric values are supported and all values are user-defined.

Field Length: System-protected
Column Name: CBPT.ORIG_BILL_TYP

Profile — An identifier used to group the services (that is, allowed transactions) available for the customer's ID. A customer profile allows you to associate customers with a particular level of service.

The value you enter in this field must first be defined to the system by back-office personnel.

Field Length: 1–8 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: CSTT.PRFL

Alternate Contact — The name of an alternate contact for this customer. This field may include the contact's phone number, if desired.

Field Length: 1–30 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: CSTT.ALT_CONTACT

Government ID — The government ID (for example, U.S. social security number) assigned to this customer. The government ID can be used to verify the identity of this customer.

Field Length: 1–15 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: PIT.GOV_T_ID

Title — The social title (for example, Mr., Mrs., Ms., Dr., Rev., etc.), civil and military title (for example, Gen., Gov., Prof., etc.), or any other title used to address this customer.

Field Length: 1–6 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: PIT.TITLE

Language — A user-defined code indicating the primary language spoken by this customer. Valid values are 00–99.

Field Length: 2 numeric characters
Required Field: No
Default Value: 00
Column Name: PIT.LANG_IND

Screen 3

Customer Signup screen 3 allows you to enter processing information about a BASE24-billpay customer ID. Customer Signup screen 3 is shown below, followed by descriptions of its fields.

```

BASE24-CORE  CUSTOMER SIGNUP          LLLL  FIID  YY/MM/DD  hh:mm  3 OF  3

```

Billing Group — The billing group assigned to this customer that defines the statement cycle for billing purposes. Any four alphanumeric characters are valid.

A row for this billing group should also exist in the BASE24-billpay Billing Group table. For additional information on the Billing Group Table, refer to the *BASE24-billpay Billing Application Manual*.

Field Length: System-protected
Column Name: CBPT.BILL_GRP

Last Cycle End Date — The date of the last billing cycle for this customer. This field is only used if the BASE24-billpay add-on Billing Application is used.

The format (for example, YYYYMMDD) in which the date in this field is displayed is provided immediately to the right of the Last Change field value on the screen.

Field Length: System-protected
Column Name: CBPT.LAST_CYCLE_END_DATE

Number Cycles Processed — The number of billing cycles that have been processed for the current billing type for this customer. This field may be blank if the billing service is not used.

Field Length: System-protected
Column Name: CBPT.NUM_CYCLES

Packet Status — A code indicating whether an informational packet explaining the billpay service has been sent to this customer. Any alphanumeric value is supported and all values are user-defined.

Field Length: System-protected
Column Name: CSTT.PCKT_STAT

Last Change — The date that the Packet Status field was last updated.

The format (for example, YYYYMMDD) in which the date in this field is displayed is provided immediately to the right of the Last Change field value on the screen.

Field Length: System-protected
Column Name: CSTT.LAST_PCKT_STAT_UPDT_TS

Last Customer/Vendor Number Assigned — The last customer vendor number used for this customer. The first value used is 1. The value is increased by one for each customer vendor assigned. Customer vendor numbers are automatically assigned by the system. Customers use customer vendor numbers to identify a vendor when making a payment. Valid values are 1–99999.

Field Length: System-protected
Column Name: CBPT.LAST_CUST_VEND_NUM

Next Tran Reference Number to be Used — The next available reference number to be used for this customer's next transaction. The first value used is 1. The value is automatically increased by one for each transaction processed for this customer. This field is maintained by the system.

Field Length: System-protected
Column Name: CBPT.NEXT_REF_NUM

Section 16

Customer Vendor Detail

The Customer Vendor Detail screen is a BASE24-billpay screen that enables you to display detailed information on each vendor to which a customer can make payments. A separate customer vendor is defined for each account relationship a customer has with a vendor.

From this screen, you can add (register) customer vendors, deactivate customer vendors, update customer vendors, and print a Customer Vendor List on behalf of the customer. A customer vendor must be verified before a customer can make payments to the customer vendor. When a customer vendor is deactivated, the customer can no longer make payments to the customer vendor.

Customer vendors can be added in two ways. You can either select an existing vendor from the Vendor Registry screen or the customer can provide you with the vendor name, address, and account information and you can add the customer vendor to the system. You should always use a registered vendor whenever possible. This ensures that the same vendor information is used by every customer that makes payments to that vendor and avoids the possibility of the same vendor being added under slightly different names.

When adding an existing vendor, select the vendor from the Vendor Registry screen. Adding vendors in this way ensures that for vendors being paid by several customers (for example, a utility company), the same information is used for the same vendor. You can access the Vendor Registry screen from the Customer Vendor Detail screen by entering the vendor name and pressing the **Shift-F4** keys. A status field on the Vendor Registry screen indicates whether the vendor has been verified. Payments can only be made to verified vendors; however, you can still add a customer vendor for an unverified vendor. The steps required to verify a vendor are dictated by your organization and are beyond the scope of this manual. Vendors are typically verified by back-office personnel before they can be used in processing.

When adding any vendor to the Vendor Registry, make sure that the vendor is not already defined in the Vendor Registry. To add an unregistered vendor, enter the vendor name, branch, address, and account information provided by the customer and press the **F5** key. This action registers the vendor to the system and creates a customer vendor.

Note: You can only add an unregistered vendor if the service provider uses an open vendor list. If the service provider uses a closed vendor list, you can select only vendors that are already registered.

A customer vendor must be created for each vendor account to which the customer makes payments. For example, if the customer is a business and makes payments to several accounts for the same vendor, a separate customer vendor must be created for each account with that vendor.

When a customer vendor is added, the Status field is initially set to the default value defined for the customer's financial institution.

The Customer Vendor Detail screen is displayed upon selecting any of the following transactions on the Transaction Menu.

- CUSTOMER VENDOR ADD
- CUSTOMER VENDOR DEACTIVATE
- CUSTOMER VENDOR REQUEST MAILING
- CUSTOMER VENDOR UPDATE
- CUSTOMER VENDOR INQUIRY
- MASTER VENDOR ADD
- MASTER VENDOR LIST INQUIRY

This screen is also displayed when you select an individual customer vendor item from a list of customer vendors on the Customer Vendor List screen and press the **F1** key.

From the Customer Vendor Detail screen you can access several other screens by pressing the appropriate function key.

Refer to section 3 of this manual for detailed procedures on perusing Customer Vendor Table rows, printing Customer Vendor Lists, adding registered and unregistered vendors, deactivating customer vendors, and updating customer vendor information.

Screen 1 Function Keys

The use of six function keys on Customer Vendor Detail screen 1 differs from that specified for the standard CSR function keys explained in section 1. The use of these function keys is explained below.

The first column of information below shows the BASE24 keys. The second column describes the functions that can be accomplished with these function keys.

Key	Description
F5	Add — Adds the currently displayed customer vendor to the system. If you are adding an unregistered vendor, this function also automatically registers the vendor to the system.
F6	Deactivate — Changes the value in the End Date field for the customer vendor to a value of one less than the current Tandem system date. Once a customer vendor expires, it can no longer be used in transaction processing. Expired customer vendor information is retained in the system until some time after the customer's Customer Vendor Year End Summary is generated.
F13	Vendor Mask — Displays the Customer Vendor Mask Verify screen. From this screen the operator can view all of the masks that are available for the current vendor and vendor branch.
Shift-F4	Vendor Registry — Displays the Vendor Registry screen. From this screen you can select a registered vendor for which a customer vendor is to be added and return the vendor information to the Customer Vendor Detail screen.
Shift-F5	Customer Vendor List — Displays the Customer Vendor List screen. This screen displays a list of all customer vendors defined for a customer. From this screen you can select an individual customer vendor for which detailed information is to be displayed on the Customer Vendor Detail screen.

Key	Description
Shift-F7	Previous — Retrieves the previous customer vendor row stored in the Customer Vendor Table (CVND) based on the key path selected. The Query CustVend Number or Query Vendor Name field define the selected key path for this screen. You must use one of these fields at least once with the Shift-F8 keys before the value of the CustVend Number or Vendor Name field is used as the selected key path with the Shift-F7 keys. Both the Query CustVend Number and Query Vendor Name fields must be blank when the Shift-F7 keys are pressed. If the CustVend Number field is the selected key path, the previous customer vendor row with a CustVend Number field value less than the current CustVend Number field value displayed is retrieved. If the Vendor Name field is the selected key path, the previous customer vendor row that matches either of the following is retrieved: • The customer vendor row with a Vendor Name field value equal to the current Vendor Name field value displayed and an Account With Vendor field value less than that currently displayed. • The customer vendor row with a Vendor Name field value less than the current Vendor Name field value.

Key	Description
Shift-F8	Next — Retrieves the next customer vendor row stored in the Customer Vendor Table (CVND) based on the key path selected. Values in the Query CustVend Number and Query Vendor Name fields when these keys are pressed determine the order in which entries are arranged, as follows: • If the Query CustVend Number field contains a value and the Query Vendor Name field is blank, this value is used as a starting point to select the next customer vendor row displayed. • If the Query Vendor Name field contains a value and the Query CustVend Number field is blank, this value is used as a starting point to select the next customer vendor row displayed. • If both the Query CustVend Number and Query Vendor Name fields are blank, the value in the CustVend Number or Vendor Name field for the customer vendor row currently displayed is used to select the next customer vendor row displayed, depending on the key path last used. You must enter a value in either the Query CustVend Number or Query Vendor Name field the first time you use the Shift-F8 keys. Thereafter, you can use the Shift-F8 keys with or without a value in the Query CustVend Number or Query Vendor Name fields.

Screen 1

Customer Vendor Detail screen 1 allows you to view detailed information for a particular Customer Vendor Table row. Customer Vendor Detail screen 1 is shown below, followed by descriptions of its fields.

BANK — The name of the customer’s financial institution. The value in this field was retrieved during customer verification processing.

Field Length: System-protected
Column Name: BANK.BANK_NAME

CUSTOMER ID — The unique identification number assigned to the customer. The value in this field was retrieved during customer verification processing.

Field Length: System-protected
Column Name: CSTT.PAN

ACCT NUMBER — An application account number for this customer. An account number is displayed in this field only if one was entered and retrieved during customer verification processing. Otherwise, this field is blank.

Field Length: System-protected
Column Name: CACT.ACCT

NAME — The customer's family name or last name, followed by the customer's given name or first name, and the customer's middle initial. The name displayed in these fields was retrieved during customer verification processing.

Field Length: System-protected
Column Names: PIT.NAM_FMLY
PIT.NAM_GIVEN
PIT.NAM_M_I

QUERY

The following two fields allow you to peruse customer vendors for this customer by entering a customer vendor number in the CustVend Number field or a vendor name in the Vendor Name field and pressing the **Shift-F8** keys. For more information on how these fields are used with the **Shift-F8** keys, refer to the "Screen 1 Function Keys" discussion provided earlier in this section.

CustVend Number — A customer vendor number used as a starting point for searching forward through customer vendors by customer vendor number using the **Shift-F8** keys.

Field Length: 1–5 numeric characters
Required Field: No
Default Value: No default value
Column Name: Not applicable

Vendor Name — A vendor name used as a starting point for searching forward through customer vendors by vendor name using the **Shift-F8** keys.

Field Length: 1–30 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: Not applicable

CustVend Number — The customer vendor number generated by the system when this customer vendor was added. This number is unique among all customer vendors for this customer. This is the number the customer must enter to initiate a payment to this customer vendor.

Field Length: System-protected
Column Name: CVND.CUST_VEND_NUM

Type — The type of vendor represented in this customer/account with vendor relationship. The vendor type is set when the vendor is added to the system. Valid values are as follows:

PUBLIC = Public vendor
LIMITED = Limited vendor

A public vendor is a vendor available for all customers and uses. A limited vendor is a vendor available for a limited number of customers and uses. A limited vendor is typically added when a customer wants to pay a person who is not a recognized business.

This field is provided for informational purposes only. It allows the system owner to categorize vendors for management purposes. Any customer can direct payments to any verified registered vendor, regardless of whether the vendor is designated as a public or limited vendor.

Field Length: System-protected
Column Name: VNDR.VEND_TYP

Vendor Name — The name of the vendor to whom this customer makes payments.

Field Length: 1–30 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: VNDR.VEND_NAME

<vndrnum> — An internal number generated by the system for this vendor. This number is unique among all registered vendors and is automatically generated when the vendor is added to the system.

Field Length: System-protected
Column Name: CVND.VEND_NUM

Remit Type — A code indicating how this vendor receives remittance for customer payments. Valid values are as follows:

ACH = Vendor is paid electronically through automated clearinghouse payments.
CIT = Vendor is paid using single-item checks.
CGP = Vendor is paid using group-item checks.

User-defined values can be used for other forms of remittance.

Field Length: System-protected
Column Name: VNDR.REMIT_TYP

Vendor Branch Name — The name of the vendor branch used by the customer.

Field Length: 1–30 alphanumeric characters
Required Field: Yes, if both of the Address fields are blank.
Default Value: No default value
Column Name: VNDB.VEND_BR_NAME

<vbrn> — An internal number that identifies the vendor branch used by the customer.

Field Length: System-protected
Column Name: CVND.VEND_BR_NUM

Address — The street or mailing address for the vendor branch used by the customer.

Field Length: 2 fields of 1–30 alphanumeric characters each
Required Field: Yes, at least one line of address information is required if the Vendor Branch Name field is blank.
Default Value: No default value
Column Names: VNDB.ADDR_1
VNDB.ADDR_2

City — The name of the city in which the vendor branch used by the customer is located.

Field Length: 1–25 alphanumeric characters
Required Field: Yes
Default Value: No default value
Column Name: VNDB.CITY

ST — The two-letter U.S. state or Canadian province abbreviation for the state in which this vendor branch is located. Reserved state codes are defined in the 1988 ANSI X3.38 standard, *Identification of the States, the District of Columbia, and the Outlying and Associated Areas of the United States for Information Interchange*.

Field Length: 2 alphanumeric characters
Required Field: Yes
Default Value: No default value
Column Name: VNDB.ST

Postal Code — The postal code of the vendor branch.

Field Length: 1–10 alphanumeric characters
Required Field: Yes
Default Value: No default value
Column Name: VNDB.POSTAL_CODE

Phone — The telephone number for the vendor branch.

Field Length: 1–20 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: VNDB.PHN

Account With Vendor — The customer's account number with this vendor. This is the number of the account to which payments from this customer are posted or credited.

Note: Some vendors may require that account number check digits be appended to the end of the account number. Check digits are typically displayed to the far right of the account number on vendor customer statements.

Field Length: 1–28 alphanumeric characters
Required Field: Yes
Default Value: No default value
Column Name: CVND.ACCT_WITH_VEND

Vendor

Status — A code identifying the current verification status of a vendor followed by a description of the code value. Reserved values are as follows:

- A = Awaiting ACH prenotification process to begin. This value is automatically set if the Remit Type is ACH so the ACH remittance processing software can identify this vendor as needing prenotification. No transactions can be paid to this vendor.
- F = Failed verification; no transactions can be paid to this vendor.
- I = Initial entry. This value is entered when the vendor row is inserted into the database. No transactions can be paid to this vendor.
- P = Pending ACH prenotification to complete; this value is used after the vendor's prenotification has been submitted for ACH processing. No transactions can be paid to this vendor.
- V = Verified vendor. Transactions can be paid to this vendor.

The values normally used are I, F, and V. ACH processing uses the value P during prenotification processing of vendors who are paid through ACH processing. Other values may be entered; however, only the value V allows transactions to be initiated by a customer.

User-defined values also can be displayed in this field. A description of the code displayed in the Status field is displayed immediately to the right of the Status field. User-defined codes are described with the text USER-DFN.

Field Length: System-protected
Column Name: VNDR.VRFY

Begin Date — The date on which this customer vendor will become available for use in transaction processing.

The format (for example, YYYYMMDD) in which the date in this field is displayed is provided immediately to the right of the Last Change field value on the screen.

Field Length: System-protected
Column Name: CVND.ACCT_BEG_DATE

End Date — The date on which this customer vendor will no longer be available for use in transaction processing. If blanks are displayed, no expiration date is set.

The format (for example, YYYYMMDD) in which the date in this field is displayed is provided immediately to the right of the Last Change field value on the screen.

Field Length: System-protected
Column Name: CVND.ACCT_END_DATE

Account

The following two fields indicate the dates defining the range for which this customer vendor can be used in processing.

Begin Date— The date on which this customer vendor will become available for use in transaction processing.

The format (for example, YYYYMMDD) in which the date in this field is displayed is provided immediately to the right of the Last Change field value on the screen.

Field Length: System-protected
Column Name: VNDR.BEG_DATE

End Date — The date on which this customer vendor will no longer be available for use in transaction processing. If blanks are displayed, no expiration date is set.

The format (for example, YYYYMMDD) in which the date in this field is displayed is provided immediately to the right of the Last Change field value on the screen.

Field Length: System-protected
Column Name: VNDR.END_DATE

Status — The current status of this customer's account with the vendor. Only customer vendors with a verified account with vendor status can be used in transaction processing. When adding an unregistered vendor for a customer, this field is set to the default value defined for the customer's financial institution. Valid values are as follows:

- INITIAL = The customer's account with vendor is initial but inactive. The customer's account with vendor must be verified before it can be used in transaction processing.
- FAILED = The customer's account with vendor failed verification processing and cannot be used in transaction processing.
- VERIFIED = The customer's account with vendor has been verified and is available for use in transaction processing.
- USER-DFN = A user-defined verification status has been assigned to this customer's account with vendor. The customer vendor cannot be used in transaction processing until the account with vendor has been verified.

Field Length: System-protected
Column Name: CVND.ACCT_VRFY

Last Change — The date on which the value in the Status field was last updated.

The format (for example, YYYYMMDD) in which the date in this field is displayed is provided immediately to the right of the Last Change field value on the screen.

Field Length: System-protected
Column Name: CVND.ACCT_VRFY_GMT

CustVend Short Name — The customer vendor short name. This field is for information only.

Field Length: 1–10 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: CVND.SHORT_NAME

User Info — Additional information and are for information about the Customer Vendor. These fields are for information only and are not used in processing.

Field Length: 1–20 alphanumeric characters
Occurs: Up to 2 times
Required Field: No
Default Value: No default value
Column Name: CVND.USER_INFO_1
CVND.USER_INFO_2

Budget Category — The budget category (for example, UTIL for utility payments or MRTG for mortgage payments) assigned to this customer vendor on behalf of the customer. A budget category is used to categorize payments made to vendors for reporting purposes. The code entered in this field must first be defined to the system by service provider or financial institution back-office personnel.

A description of the code entered is displayed to the right of the Budget Category field.

Field Length: 1–4 alphanumeric characters
Required Field: Yes
Default Value: No default value
Column Name: CVND.BGT_CAT

Screen 2 Function Keys

The use of six function keys on Customer Vendor Detail screen 2 differs from that specified for the standard CSR function keys explained in section 1. The use of these function keys is explained below.

The first column of information below shows the BASE24 keys. The second column describes the functions that can be accomplished with these function keys.

Key	Description
F5	Add — Adds the currently displayed customer vendor to the system. If you are adding an unregistered vendor, this function also automatically registers the vendor to the system.
F6	Deactivate — Changes the value in the End Date field for the customer vendor to a value of one less than the current Tandem system date. Once a customer vendor expires, it can no longer be used in transaction processing. Expired customer vendor information is retained in the system until some time after the customer's Customer Vendor Year End Summary is generated.
F13	Vendor Mask — Displays the Customer Vendor Mask Verify screen. From this screen the operator can view all of the masks that are available for the current vendor and vendor branch.
Shift-F4	Vendor Registry — Displays the Vendor Registry screen. From this screen you can select a registered vendor for which a customer vendor is to be added and return the vendor information to the Customer Vendor Detail screen.
Shift-F5	Customer Vendor List — Displays the Customer Vendor List screen. This screen displays a list of all customer vendors defined for a customer. From this screen you can select an individual customer vendor for which detailed information is to be displayed on the Customer Vendor Detail screen.

Key	Description
Shift-F7	Previous — Retrieves the previous customer vendor row stored in the Customer Vendor Table (CVND) based on the key path selected. The Query CustVend Number or Query Vendor Name field define the selected key path for this screen. You must use one of these fields at least once with the Shift-F8 keys before the value of the CustVend Number or Vendor Name field is used as the selected key path with the Shift-F7 keys. Both the Query CustVend Number and Query Vendor Name fields must be blank when the Shift-F7 keys are pressed. If the CustVend Number field is the selected key path, the previous customer vendor row with a CustVend Number field value less than the current CustVend Number field value displayed is retrieved. If the Vendor Name field is the selected key path, the previous customer vendor row that matches either of the following is retrieved: • The customer vendor row with a Vendor Name field value equal to the current Vendor Name field value displayed and an Account With Vendor field value less than that currently displayed. • The customer vendor row with a Vendor Name field value less than the current Vendor Name field value.

Key	Description
Shift-F8	Next — Retrieves the next customer vendor row stored in the Customer Vendor Table (CVND) based on the key path selected. Values in the Query CustVend Number and Query Vendor Name fields when these keys are pressed determine the order in which entries are arranged, as follows: • If the Query CustVend Number field contains a value and the Query Vendor Name field is blank, this value is used as a starting point to select the next customer vendor row displayed. • If the Query Vendor Name field contains a value and the Query CustVend Number field is blank, this value is used as a starting point to select the next customer vendor row displayed. • If both the Query CustVend Number and Query Vendor Name fields are blank, the value in the CustVend Number or Vendor Name field for the customer vendor row currently displayed is used to select the next customer vendor row displayed, depending on the key path last used. You must enter a value in either the Query CustVend Number or Query Vendor Name field the first time you use the Shift-F8 keys. Thereafter, you can use the Shift-F8 keys with or without a value in the Query CustVend Number or Query Vendor Name fields.

Screen 2

Customer Vendor Detail screen 2 contains additional information about the vendor and the vendor branch as well as remittance information. Customer Vendor Detail screen 2 is shown below, followed by descriptions of its fields.

```

Vendor Branch

The following four fields contain information about the vendor branch.

Information 1 — This field contains customer-specific information about the customer vendor branch. This field is for information only.

Field Length: 1 to 20 alphanumeric characters
 Required Field: No
 Default Value: No default value
 Column Name: VNDB.USER_INFO_1

Information 2 — This field contains customer-specific information about the customer vendor branch. This field is for information only.

Field Length: 1 to 20 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: VNDB.USER_INFO_2

Remit Information 1 — Specific information about the remittance that is required by the vendor. The information must be included in the remittance file produced for the vendor's remittance type.

Field Length: 1 to 20 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: VNDB.USER_REMIT_INFO_1

Remit Information 2 — Specific information about the remittance that is required by the vendor. The information must be included in the remittance file produced for the vendor's remittance type.

Field Length: 1 to 20 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: VNDB.USER_REMIT_INFO_2

Vendor

The following four fields contain information about the vendor.

Information 1 — This field contains customer-specific information about the customer vendor. This field is for information only.

Field Length: 1 to 20 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: VNDR.USER_INFO_1

Information 2 — This field contains customer-specific information about the customer vendor. This field is for information only.

Field Length: 1 to 20 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: VNDR.USER_INFO_2

Remit Information 1 — Specific information about the remittance that is required by the vendor. The information must be included in the remittance file produced for the vendor's remittance type.

Field Length: 1 to 20 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: VNDR.USER_REMIT_INFO_1

Remit Information 2 — Specific information about the remittance that is required by the vendor. The information must be included in the remittance file produced for the vendor's remittance type.

Field Length: 1 to 20 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: VNDR.USER_REMIT_INFO_2

Section 17

Customer Vendor List

The Customer Vendor List screen is a BASE24-billpay screen that allows you to view a list of up to five customer vendors at a time. From this list, you can select a customer vendor to which a payment is to be made, or for which detailed information is to be displayed.

You can access the Customer Vendor List screen using the **Shift-F5** function keys on either the New Payment or Customer Vendor Detail screens.

The Customer Vendor List screen allows you to peruse customer vendors based on a customer vendor number or a vendor name. Using the Query CustVend Number field or the Query Vendor Name field and the **Shift-F7** and **Shift-F8** function keys, you can move backward or forward through the customer vendors.

When you find the customer vendor you are searching for, position the cursor on the same line as the customer vendor entry and press the **F1** key. The customer vendor information is returned to the screen from which you accessed the Customer Vendor List screen. If you accessed this screen from the New Payments screen, the customer vendor number, vendor name, and account with vendor are returned to the New Payment screen. If you accessed this screen from the Customer Vendor Detail screen, all information defined for the customer vendor in the system is displayed on the Customer Vendor Detail screen.

From the Customer Vendor List screen, you can also request a Customer Vendor List to be printed and sent to the customer, access the Transaction Menu, or access the Customer Verify screen by pressing the appropriate function key.

Refer to section 3 of this manual for detailed procedures on listing customer vendors and printing Customer Vendor Lists.

Screen 1 Function Keys

The use of three function keys on Customer Vendor List screen 1 differs from that specified for the standard CSR function keys explained in section 1. The use of these function keys is explained below.

The first column of information below shows the BASE24 keys. The second column describes the functions that can be accomplished with these function keys.

Key	Description
F1	Select Customer Vendor and Return — Selects the customer vendor displayed on the same line of the screen as the cursor and returns this information to the screen from which the Customer Vendor List screen was accessed.
Shift-F7	Previous — Retrieves the previous five customer vendor rows stored in the Customer Vendor Table (CVND) based on the key path selected. The Query CustVend Number or Query Vendor Name field defines the selected key path for this screen. You must use one of these fields at least once with the Shift-F8 keys before the value of the CustVend Number or Vendor Name field is used as the selected key path with the Shift-F7 keys. Both the Query CustVend Number and Query Vendor Name fields must be blank when the Shift-F7 keys are pressed. If the CustVend Number field is the selected key path, the previous five customer vendor rows with a CustVend Number field value less than that of the first entry displayed are retrieved. If the Vendor Name field is the selected key path, the previous five customer vendor rows that match either of the following are retrieved: • Customer vendor rows with a Vendor Name field value equal to the Vendor Name field value currently displayed for the first entry on the screen and an Account With Vendor field value less than that currently displayed for the first entry. • Customer vendor rows with a Vendor Name field value less than that currently displayed for the first entry on the screen.

Key	Description
Shift-F8	Next — Retrieves the next five customer vendor row stored in the Customer Vendor Table (CVND) based on the key path selected. Values in the Query CustVend Number and Query Vendor Name fields when these keys are pressed determine the order in which entries are arranged, as follows: • If the Query CustVend Number field contains a value and the Query Vendor Name field is blank, this value is used as a starting point to select the next five customer vendor rows displayed. • If the Query Vendor Name field contains a value and the Query CustVend Number field is blank, this value is used as a starting point to select the next five customer vendor rows displayed. • If both the Query CustVend Number and Query Vendor Name fields are blank, the value in the CustVend Number or Vendor Name field for the last entry currently displayed on the screen is used to select the next five customer vendor rows displayed, depending on the key path last used. You must enter a value in either the Query CustVend Number or Query Vendor Name field the first time you use the Shift-F8 keys. Thereafter, you can use the Shift-F8 keys with or without a value in the Query CustVend Number or Query Vendor Name fields.
Shift-F9	Customer Vendor Request Mailing — Places a CUSTVEND row in the Report Action Table which is to be processed during the next run of the Customer Vendor Report program. The report produces a list of the customer's vendors that is suitable for mailing to the customer. It also generates an entry in the History Table.

Screen 1

Customer Vendor List screen 1 allows you to view summary information for up to five customer vendors at a time. From this list, you can select a customer vendor to which a payment is to be made, or for which detailed information is to be displayed. Place the cursor to the left of the customer vendor name. Press the **F1** key to select the customer vendor displayed. Customer Vendor List screen 1 is shown below, followed by descriptions of its fields.

BANK — The name of the customer’s financial institution. The value in this field was retrieved during customer verification processing.

Field Length: System-protected
Column Name: BANK.BANK_NAME

CUSTOMER ID — The unique identification number assigned to the customer. The value in this field was retrieved during customer verification processing.

Field Length: System-protected
Column Name: CSTT.PAN

ACCT NUMBER — An application account number for this customer. An account number is displayed in this field only if one was entered and retrieved during customer verification processing. Otherwise, this field is blank.

Field Length: System-protected
Column Name: CACT.ACCT

NAME — The customer's family name or last name, followed by the customer's given name or first name, and the customer's middle initial. The name displayed in these fields was retrieved during customer verification processing.

Field Length: System-protected
Column Names: PIT.NAM_FMLY
PIT.NAM_GIVEN
PIT.NAM_M_I

QUERY

The following two fields allow you to peruse customer vendors for this customer by entering a customer vendor number in the CustVend Number field or a vendor name in the Vendor Name field and pressing the **Shift-F8** keys. For more information on how these fields are used with the **Shift-F8** keys, refer to the "Screen 1 Function Keys" discussion provided earlier in this section.

CustVend Number — A customer vendor number used as a starting point for searching forward through customer vendors by customer vendor number using the **Shift-F8** keys.

Field Length: 1–5 numeric characters
Required Field: No
Default Value: No default value
Column Name: Not applicable

Vendor Name — A vendor name used as a starting point for searching forward through customer vendors by vendor name using **Shift-F8** keys.

Field Length: 1–30 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: Not applicable

Cust Vendor Number — The customer vendor number generated by the system when this customer vendor was added. This number is unique among all customer vendors for this customer. This is the number the customer must enter to initiate a payment to this customer vendor.

Field Length: System-protected
Occurs: Up to 5 times
Column Name: CVND.CUST_VEND_NUM

Vendor Name — The name of the vendor to whom this customer makes payments.

Field Length: System-protected
Occurs: Up to 5 times
Column Name: VNDR.VEND_NAME

Vendor Branch Name — The name of the vendor branch used by the customer.

Field Length: System-protected
Occurs: Up to 5 times
Column Name: VNDB.VEND_BR_NAME

Customer Account With Vendor — The customer's account number with this vendor. This is the number of the account to which payments from this customer are posted or credited.

Field Length: System-protected
Occurs: Up to 5 times
Column Name: CVND.ACCT_WITH_VEND

Verify Status — The current status of this customer vendor. Only customer vendors with a VERIFIED status can be used in transaction processing. Valid values are as follows:

INITIAL = The customer vendor is initial but inactive. The customer vendor must be verified before it can be used in transaction processing.

FAILED = The customer vendor failed verification processing and cannot be used in transaction processing.

VERIFIED = The customer vendor has been verified and is available for use in transaction processing.

USER-DFN = A user-defined verification status has been assigned to this customer vendor. The customer vendor cannot be used in transaction processing until it has been verified.

Field Length: System-protected
Occurs: Up to 5 times
Column Name: CVND.ACCT_VRFY

Date Range — The dates on which this customer vendor will be available for use in transaction processing. The first date displayed indicates when the customer vendor will become available for use in processing. The second date displayed indicates when the customer vendor will no longer be available for use in processing. The current date must fall within the date range specified before a customer vendor can be using in transaction processing. All blanks in both date fields indicate that no date restrictions exist. A date in the first field and blanks in the second field indicate that no expiration date is set.

The format (for example, YYYYMMDD) in which the dates in this field are displayed is provided immediately below the Date Range field label on the screen.

Field Length: System-protected
Occurs: Up to 5 times
Column Names: CVND.ACCT_BEG_DATE
CVND.ACCT_END_DATE

Remit Typ — A code indicating how this vendor receives remittance for customer payments. Valid values are as follows:

ACH = Vendor is paid electronically through automated clearinghouse payments.
CIT = Vendor is paid using single-item checks.
CGP = Vendor is paid using group-item checks.

User-defined values can be used for other forms of remittance.

Field Length: System-protected
Occurs: Up to 5 times
Column Name: VNDR.REMIT_TYP

ACI Worldwide Inc.

Section 18

Customer Vendor Mask Verify

The Customer Vendor Mask Verify screen is a BASE24-billpay screen that allows you to review all account masks that are defined for the current vendor and vendor branch combination on the Customer Vendor Detail screen. The Customer Vendor Mask Verify screen also allows you to verify potential values for the Account With Vendor field on the Customer Vendor Detail screen or to view detailed information on a selected account mask.

Account masks are edit checks used to ensure that the customer's account with vendor meets the requirements of the vendor. An edit mask can consist of an account number minimum and maximum length check, account mask matching, or a user-defined algorithm check. Account mask matching checks the entered account number against a template of text and wildcard characters.

You can access the Customer Vendor Mask Verify screen using the **F13** key on the Customer Vendor Detail screen. If a value exists in the Account With Vendor field when you press this key, the value is also verified against each account mask. The Description field indicates whether the value passed or failed the edit for each account mask.

The Customer Vendor Mask Verify screen allows you to peruse account masks based on the account with vendor. Using the Query Account With Vendor field and the **Shift-F7** and **Shift-F8** function keys, you can move backward or forward through the account masks. If you change the value in the Query Account With Vendor field and press the **Shift-F8** keys, the new value is verified against each account mask.

You can display detailed information for a particular account mask by positioning the cursor on the same line as the account mask entry and pressing the **F1** key. The Customer Vendor Mask Verify Detail screen is displayed. Press the **F16** key to return to the Customer Vendor Mask Verify screen.

After the account with vendor value is successfully verified against all applicable account masks, you can return the value to the Account With Vendor field on the Customer Vendor Detail screen by pressing the **F13** key.

Screen 1 Function Keys

The use of two function keys on the Customer Vendor Mask Verify screen differs from that specified for the standard CSR function keys explained in section 1. The use of these function keys is explained below.

The first column of information below shows the BASE24 keys. The second column describes the functions that can be accomplished with these function keys.

Key	Description
F1	Display Customer Vendor Mask Verify Detail screen — Displays the Customer Vendor Mask Verify Detail screen for the Account Mask at the cursor position.
F13	Return Account with Vendor to the previous screen — Displays the Customer Vendor Detail screen.

Screen 1

Customer Vendor Mask Verify screen 1 is a BASE24-billpay screen that is used to review all account masks for the current Vendor and Vendor Branch combination. It also provides a way to verify potential values for the Account With Vendor field. Customer Vendor Mask Verify screen 1 is shown below, followed by descriptions of its fields.

Field Length: System-protected
Column Names: PIT.NAM_FMLY
PIT.NAM_GIVEN
PIT.NAM_M_I

Query

The following field allows you to peruse account masks based on the account with vendor. Using this field and the **Shift-F7** and **Shift-F8** function keys, you can move backward or forward through the account masks. If you change the value in the Query Account With Vendor field and press the **Shift-F8** keys, the new value is verified against each account mask.

Account With Vendor — The customer's account number with this vendor. This is the number of the account to which payments from this customer are posted or credited.

Note: Some vendors may require that account number check digits be appended to the end of the account number. Check digits are typically displayed to the far right of the account number on vendor customer statements.

Field Length: 1 to 28 alphanumeric characters
Required: No
Default Value: No default value
Column Name: Not applicable

Mask Group — The name of the mask used to verify the account numbers customers have with this vendor.

Field Length: System-protected
Column Name: VNDM.MASK_GRP

Account With Vendor — The customer account with the vendor that is credited with any customer payments. Any value entered in this field must conform to the Vendor Mask Table (VNDM) entries for this vendor and vendor branch combination.

Field Length: System-protected
Column Name: CVND.ACCT_WITH_VEND

Account Mask — An edit mask that is used to analyze the account number a customer has with a vendor. The combination of values in the Mask Group and Account Mask fields must be unique. The edit that uses this value is performed after account lengths are checked and before a user-defined algorithm is checked.

The edit mask may contain combinations of the following characters to represent the valid format of an account number:

- A = Matches any alphabetic character (A through Z).
- X = Matches any alphanumeric character (A through Z, 0 through 9).
- 9 = Matches any digit (0 through 9).
- ? = Matches any single character.
- * = Matches any number of characters (including none).
- “text” = Matches *text*, where *text* is the group of characters being matched. Since single quotation marks indicate where the text being matched begins and ends, use two quotation marks together to represent a quotation mark that appears in the text being matched.

The following table contains examples of account masks and possible account numbers that match each mask:

Example	Account Masks	Matching Account Numbers
1	“AX”AA999??*	AXZZ123/-15 AXPQ921(Q) AXAB45689
2	“ABC”“DE”9	ABC”DE0 through ABC”DE9
3	A9A99	X1B23 R5T76
4	All blanks	All account numbers

In example 1, the characters in the first nine positions of the account number must be AX, two alphabetic characters, three numeric characters, and two characters of any kind. The asterisk (*) in the mask permits the remaining positions of the account number to contain any number of additional characters. The account number must have at least nine characters.

In example 2, the characters in the first six positions of the account number must be ABC"DE and the seventh position of the account number must contain a number. The two quotation marks between the C and D in the account mask indicate a single quotation mark in the text. Since the account mask does not contain an asterisk (*), the account number must be seven characters in length.

In example 3, the characters in the first and third positions of the account number must be letters and the characters in the second, fourth, and fifth positions of the account number must be numbers. Since the account mask does not contain an asterisk (*), the account number must be five characters in length.

In example 4, all account numbers match because the account mask is all blanks.

Field Length: System-protected
Column Name: VNDM.ACCT_MASK

Ind — A code indicating the status of the Vender Mask Verification transaction. Valid values are as follows:

00 = Accepted
01 = No account
02 = Failed minimum
03 = Failed maximum
04 = Failed mask
05 = Failed usercheck

Field Length: System-protected
Column Name: Not applicable

Description — The description of the codes in the Ind field.

Field Length: System-protected
Column Name: Not applicable

Min — The vendor mask minimum length. The length of the Account With Vendor field must be greater than or equal to the minimum.

Field Length: System-protected
Column Name: VNDM.MIN_LEN

Max — The vendor mask maximum length. The length of the Account With Vendor field must be less than or equal to the maximum.

Field Length: System-protected
Column Name: VNDM.MAX_LEN

ACI Worldwide Inc.

Section 19

Customer Vendor Mask Verify Detail

The Customer Vendor Mask Verify Detail screen allows you to view detailed information for a particular account mask selected on the Customer Vendor Mask Verify screen.

This information can be helpful in determining why an account with vendor value failed a particular account mask edit check. The screen displays comments describing the intended use of the account mask and help text to assist you in using the account mask correctly.

You can access the Customer Vendor Mask Verify Detail screen by selecting an account mask entry on the Customer Vendor Mask Verify screen and pressing the **F1** key. You can return to the Customer Vendor Mask Verify screen by pressing the **F16** key.

Screen 1 Function Keys

The use of one function key on the Customer Vendor Mask Verify Detail screen differs from that specified for the standard CSR function keys explained in section 1. The use of this function key is explained below.

The first column of information below shows the BASE24 key. The second column describes the functions that can be accomplished with this function key.

Key	Description
F2	Display Customer Verify Request Screen — Selects the Customer Verify Request screen.

Field Length: System-protected
Column Name: CACT.ACCT

NAME — The customer's family name or last name, followed by the customer's given name or first name, and the customer's middle initial. The name displayed in these fields was retrieved during customer verification processing.

Field Length: System-protected
Column Names: PIT.NAM_FMLY
PIT.NAM_GIVEN
PIT.NAM_M_I

Account With Vendor — The customer account with the vendor that is credited with any customer payments. Any value entered in this field must conform to the Vendor Mask Table (VNDM) entries for this vendor and vendor branch combination.

Field Length: System-protected
Column Name: CVND.ACCT_WITH_VEND

Verification Failed

The following two fields provide an indication and description of the reason the Customer Vendor Mask Verification transaction failed.

Indicator — A code indicating the status of the Vendor Mask Verification transaction. Valid values are as follows:

00 = Accepted
01 = No account
02 = Failed minimum
03 = Failed maximum
04 = Failed mask
05 = Failed usercheck

Field Length: System-protected
Column Name: Not applicable

Description — The description of the code in the Ind field.

Field Length: System-protected

Column Name: Not applicable

Mask Group — The name of the mask used to verify the account numbers customers have with this vendor.

Field Length: System-protected

Column Name: VNDM.MASK_GRP

Minimum Length — The vendor mask minimum length. The length of the Account With Vendor field must be greater than or equal to the minimum.

Field Length: System-protected

Column Name: VNDM.MIN_LEN

Maximum Length — The vendor mask maximum length. The length of the Account With Vendor field must be less than or equal to the maximum.

Field Length: System-protected

Column Name: VNDM.MAX_LEN

User Check Number — A number that identifies a user-defined algorithm used to analyze the account number a customer has with a vendor. The edit that uses this value is performed after account number lengths or account masking are checked. Valid values are as follows:

- 0 = The account number is considered valid without being analyzed (default value).
Note: This value does not appear in the User Check Number field.
- 1–50 = The account number is analyzed with the user-defined algorithm identified by this value. The value in this field represents the numeric value in a CASE statement in the software into which the user-defined algorithm is inserted. The standard BASE24-billpay product does not have any account number algorithms.
- 51–9999 = The account number is considered invalid without being analyzed.

Note: Numbers between 51 and 9999 can be used if the CASE statement is changed to recognize them.

Field Length: System-protected
Column Name: VNDM.USER_CK_NUM

Account Mask — A value that indicates the form the Account With Vendor must take.

Field Length: System-protected
Column Name: VNDM.ACCT_MASK

Comment — A free-format, information only field used to describe the use of the account mask. This field is for information only.

Field Length: System-protected
Column Name: VNDM.CMNT

Help Text — A free-format field for information only.

Field Length: System-protected
Column Name: VNDM.HELP_TEXT

Section 20

Customer Verify Request

The Customer Verify Request screen is a BASE24-telebanking screen that is the first screen displayed when you select the CSRC entry from the Virtual Menu. This screen is also displayed any time you press the **F2** function key on any CSR screen to change customers.

The Customer Verify Request screen is used by both the BASE24-billpay and BASE24-telebanking products to perform customer verification.

For existing customers, this screen enables you to verify the authenticity of the customer. For new customers, this screen enables you to enter the name of customers requesting to sign up for BASE24-billpay service or to apply for a loan. You must access this screen every time you begin a new session with a different customer.

Each time you begin processing for a different customer, you must enter the appropriate customer identification information on this screen. This includes one of the following:

- The customer's ID (this is also known as the primary account number or PAN). The customer ID entered must be defined to the system.
- The number of an application account owned by the customer. The account number entered must be defined to the system.
- The full or partial customer name.

You can enter only one of the above identifying items. If you attempt to enter more than one of the above, an error message will be displayed on the screen.

To verify the authenticity of a customer on this screen, enter one of the following: customer ID, customer name, or application account number. Press the **F2** key to verify the customer.

The Customer Verify Response screen will be displayed unless one of the following occurs:

- More than one customer has access to the entered customer ID
- You enter a customer name
- You enter an unknown customer ID or account number

For all of the above cases, except the last, the Multiple Customer Selection screen may be displayed. You must select an individual customer ID and customer combination on the Multiple Customer Selection screen before the Customer Verify Response screen is displayed. If you misspell the customer name, an error message may be displayed instead of the Multiple Customer Selection screen (see the NAME field description for more information). If you enter an unknown customer ID or account number, an error message is displayed.

To sign up a new customer for remote banking service, enter the customer name and press the **F8** key. The Bank List screen will be displayed. After you select a financial institution for the customer from this screen, either the Customer Signup screen or the Customer Verify screen is displayed. The Customer Verify screen is only displayed if the customer's data has been preloaded to the system. In which case, you must verify the customer using the **F2** key before access to the Customer Signup screen is allowed.

To enter a loan application for a customer, enter the customer name and press the **F7** key. The Loan Application screen will be displayed.

The name of the customer's financial institution is displayed in the BANK field when a configured customer is verified. If you are signing up a new customer, you must first select a financial institution name from the Bank List screen before entry to the Customer Signup screen is allowed.

Screen 1 Function Keys

The use of two function keys on the Customer Verify Request screen differs from that specified for the standard CSR function keys explained in section 1. The use of these function keys is explained below.

The first column of information below shows the BASE24 keys. The second column describes the functions that can be accomplished with these function keys.

Key	Description
F7	Loan Application — Displays the BASE24-billpay Loan Application screen. This screen enables you to enter a loan application on behalf of the customer.
F8	Customer Signup — Displays the BASE24-billpay Customer Signup screen. This screen enables you to sign up new customers for remote banking service.

Screen 1

Customer Verify Request screen 1 enables you to identify the customer for which CSR processing is to be performed. Customer Verify Request screen 1 is shown below, followed by descriptions of its fields.

```
BASE24-CORE  CSR CONTROL          LLLL          YY/MM/DD  hh:mm  01 OF 01

      BANK:                      CUSTOMER ID:          OR
ACCT NUMBER:                    OR NAME:                ,
```

```
***** BASE24 *****
FILE DESTINATION:
F2-VERIFY CUSTOMER  F7-LOAN APPLICATION  F8-CUSTOMER SIGNUP  F12-HELP
```

BANK — The name of the customer’s financial institution. The name displayed in this field is automatically retrieved by the system when you verify the customer.

Field Length: System-protected
Column Name: BANK.BANK_NAME

CUSTOMER ID — The unique identification number assigned to this customer. An unlimited number of individual application accounts and persons can be associated with one customer ID, and one customer can be associated with several customer IDs. The customer ID entered in this field must match a customer ID defined in the system.

If more than one customer has access to the specified customer ID, the Multiple Customer Selection screen will be displayed when you press the **F2** key. You must then select an individual customer on this screen and press the **F1** key to continue customer verification processing.

Field Length:	1–19 numeric characters
Required Field:	Yes, if no entries are made in either the ACCT NUMBER or NAME fields.
Default Value:	No default value
Column Name:	CSTT.PAN

ACCT NUMBER — An application account number for this customer. The account number entered in this field must match an application account number configured to the system for the customer.

Field Length:	1–19 numeric characters
Required Field:	Yes, if no entries are made in either the CUSTOMER ID or NAME fields.
Default Value:	No default value
Column Name:	CACT.ACCT

NAME — The family name or last name of the customer, followed by the given name or first name of the customer, and the customer's middle initial.

If you enter a name, you must at least enter a family name. If you enter a middle initial, you must also enter a given name.

If your system uses a name token algorithm (for example, Soundex), you should always attempt to enter the full customer name as accurately as possible to effectively narrow the search for the configured customer information.

If your system does not use a name token algorithm, you should enter only as many characters of the customer name that you know are correct. If you misspell the name, the system may not be able to find the configured customer information and an error message may be displayed.

These fields accept special characters required for languages other than U.S. English.

Field Length: 1–20 alphanumeric or special characters (family name)
1–10 alphanumeric or special characters (given name)
1 alphabetic or special character (middle initial)

Required Field: Yes, if no entries are made in either the CUSTOMER ID or
ACCT NUMBER fields.

Default Value: No default value

Column Names: PIT.NAM_FMLY
PIT.NAM_GIVEN
PIT.NAM_M_I

Section 21

Customer Verify Response

The Customer Verify Response screen is used by both the BASE24-billpay product and the BASE24-telebanking product to perform customer verification.

The Customer Verify Response screen is displayed when you press the **F2** key on the Customer Verify Request screen to verify a customer, unless the system is unable to identify the customer from the information entered. In this case, the Multiple Customer Selection screen is displayed or the request is denied. You must then either select the individual customer from the Multiple Customer Selection screen or reverify the customer on the Customer Verify Request screen before the Customer Verify Response screen is displayed.

Upon entry to the Customer Verify Response screen, the screen indicates whether a personal identification number (PIN) is required for this customer and whether the customer is required to change the PIN. The screen also displays a flag indicating whether the customer is an individual or business, the current verification status of the customer's ID, and any customer verification information (for example, government ID, mother's maiden name, etc.) configured for the customer.

Using the Customer Verify Response screen, you can verify or change the customer's PIN, verify the authenticity of the customer by reviewing the personal information displayed in the CUSTOMER VERIFICATION INFORMATION fields or by accessing detailed personal customer information on the Customer Personal Detail screen, and access the Customer Signup screen to sign up a new customer for remote banking service.

Once you have finished verifying a customer, you can press the **F4** key to display the Transaction Menu. This screen enables you to select transactions to be performed on behalf of the customer. If at any time you need to change customers, you can return to the Customer Verify Request screen by pressing the **F2** key.

Screen 1 Function Keys

The use of five function keys on Customer Verify Response screen 1 differs from that specified for the standard CSR function keys explained in section 1. The use of these function keys is explained below.

The first column of information below shows the BASE24 keys. The second column describes the function that can be accomplished with these function keys.

Key	Description
F3	PIN Verify — Displays Authorization Request screen 1 (PIN verify). This screen enables you to enter and authorize a customer's personal identification number (PIN). Note: If you attempt to verify the customer's PIN and a PIN change is required, Authorization Request screen 1 (PIN change) screen is displayed instead. The PIN change transaction always takes priority over the PIN verify transaction.
F4	Transaction Menu — Displays the Transaction Menu. Note: If you attempt to access this menu without first verifying or changing the customer's PIN when required, the appropriate Authorization Request screen 1 (PIN verify or PIN change) is displayed instead.
F5	Personal Detail — Displays the Customer Personal Detail screen. This screen displays detailed personal information configured for the customer. This information can be used to verify the authenticity of the customer. It cannot be used to update personal customer information. Customer personal information can only be updated using the Customer Information or Customer Signup screens.
F6	PIN Change — Displays Authorization screen 1 (PIN change). This screen enables you to change the PIN on behalf of a customer. Note: If the customer's financial institution does not allow the PIN change transaction, this function key is not available and is not displayed as an option on the screen.

Key	Description
F8	Customer Signup — Displays the BASE24-billpay Customer Signup screen. This screen enables you to sign up new customers for remote banking service.

Screen 1

Customer Verify Response screen 1 enables you to verify the authenticity of the customer. Customer Verify Response screen 1 is shown below, followed by descriptions of its fields.

```
BASE24-CORE  CSR CONTROL          LLLL          YY/MM/DD  hh:mm  01 OF 01

      BANK:
ACCT NUMBER:          CUSTOMER ID:
                        NAME:

      PIN OPTION:
      PIN CHANGE REQUIRED:
      CUSTOMER TYPE:
CUSTOMER VERIFY STATUS:

                        CUSTOMER VERIFICATION INFORMATION

***** BASE24 *****
                        FILE DESTINATION:
F2-CHANGE CUSTOMER          F3-PIN VERIFY          F4-TRANSACTION MENU
F5-PERSONAL DETAIL  F6-PIN CHANGE  F8-CUSTOMER SIGN UP  F12-HELP
```

BANK — The name of the customer’s financial institution. The value in this field is retrieved from the system when the customer is verified.

Field Length: System-protected
Column Name: BANK.BANK_NAME

CUSTOMER ID — The unique identification number assigned to the customer. The value in this field is either passed from the Customer Verify Request screen or the Multiple Customer Selection screen, or retrieved from the system if the customer ID was not entered on the Customer Verify Request screen.

Field Length: System-protected
Column Name: CSTT.PAN

ACCT NUMBER — An application account number for this customer. An account number is displayed in this field only if one was entered and retrieved during customer verification processing. Otherwise, this field is blank.

Field Length: System-protected
Column Name: CACT.ACCT

NAME — The family name or last name of the customer, followed by the given name or first name of the customer, and the customer's middle initial. The name displayed in these fields was either entered on the Customer Verify Request screen or retrieved from the system when the customer was verified.

These fields can display special characters required for languages other than U.S. English.

Field Length: System-protected
Column Names: PIT.NAM_FMLY
PIT.NAM_GIVEN
PIT.NAM_M_I

PIN OPTION — Text indicating the PIN option for this customer. Valid values are as follows:

PIN IS REQUIRED = A PIN is required to execute transactions for this customer.

PIN IS NOT REQUIRED = A PIN is not required to execute transactions for this customer.

PIN PREFERRED, NOT REQUIRED = A PIN is preferred, but not required, to execute transactions for this customer. This means that the customer's financial institution normally requires a PIN, but you can still authorize a customer transaction without a PIN if you are confident of the customer's identity through other means.

UNKNOWN = The PIN option for this customer is not known.

Field Length: System-protected
Column Name: Not applicable

PIN CHANGE REQUIRED — A flag indicating whether a customer needs to initiate a PIN change transaction. This field is set to the value N after a successful PIN change transaction is performed. Valid values are as follows:

- Y = Yes, a PIN change is required. The customer must change his or her current PIN; the only transaction allowed is the PIN change transaction.
- N = No, a PIN change is not required; the current PIN can be used.
- S = Customer select. The customer must select his or her initial PIN; the only transaction allowed is the PIN change transaction.

Field Length: System-protected
Column Name: CSTT.PIN_CHNG_REQ

CUSTOMER TYPE — A code identifying the type of customer associated with this customer ID. This is an information-only field that is not used in processing. Valid values are as follows:

- Bb = Business customer
- Cb = Individual customer

A description of the code is displayed immediately to the right of the value in the CUSTOMER TYPE field.

Field Length: System-protected
Column Name: CSTT.TYP

CUSTOMER VERIFY STATUS — A code identifying the status of the customer relationship (customer ID). Reserved values are as follows:

- I = Issued but inactive. The customer ID cannot be used in financial transaction processing until it is activated.
- V = Verified. The customer ID can be used in financial transaction processing.
- C = Closed. The customer ID cannot be used in financial transaction processing.

Additional user-defined codes may be displayed; however, all user-defined codes are treated the same as the closed status.

A description of the code is displayed immediately to the right of the value in the CUSTOMER VERIFY STATUS field. For all user-defined codes, the phrase CLOSED, USER DEF is displayed.

Field Length: System-protected
Column Name: CSTT.VRFY_FLG

CUSTOMER VERIFICATION INFORMATION — User-defined customer verification information. This information can be used for customer verification purposes if the Customer Personal Detail screen is not used. For example, if these fields display the customer's government ID, birth date, and mother's maiden name, you can request that the customer provide some or all of this information for identification purposes.

Field Length: System-protected
Column Names: CSTT.CUST_INFO_1
 CSTT.CUST_INFO_2
 CSTT.CUST_INFO_3

ACI Worldwide Inc.

Section 22

Last Transaction Response

The Last Transaction Response screen is a BASE24-telebanking screen displayed when any of the following BASE24-telebanking transactions are approved.

- CHECK CLEARANCE INQUIRY
- LAST COUNT CHECK INQUIRY
- LAST COUNT CREDIT INQUIRY
- LAST COUNT DB/CR INQUIRY
- LAST COUNT DEBIT INQUIRY
- LAST COUNT SOURCE INQUIRY
- LAST COUNT TRANSFER INQUIRY

When any of these transactions are denied, the Authorization Response screen is displayed instead.

The Last Transaction Response screen overlays the bottom half of the Authorization Request screen from which the transaction was entered. This enables you to view both the transaction request and response data at the same time.

The Last Transaction Response screen lists up to five transactions from the Transaction History File (THF) that match the criteria specified in the inquiry transaction. If a transaction is not recorded in this file, it cannot be displayed on this screen. Transactions are periodically removed from this file (archived) after a configurable period of time. Your supervisor should be able to tell you how long transactions are retained in this file before they are archived.

Screen 1 Function Keys

The use of one function key on Last Transaction Response screen 1 differs from that specified for the standard CSR function keys explained in section 1. The use of this function key is explained below.

The first column of information below shows the BASE24 key. The second column describes the function that can be accomplished with this function key.

Key	Description
F9	More Information — Searches for any additional transactions that may exist. Currently, the only way to tell when no additional transactions are available is if no additional transactions are displayed when you press the F9 key. You can continue to press the F9 key until no additional transactions are displayed.

Screen 1

Last Transaction Response screen 1 shows you approved responses to all BASE24-telebanking inquiries on previous transactions.

This screen reports on up to five transactions of the type requested from the THF, beginning with the most recently posted transactions. You can display additional transactions, with posting dates less than the last currently displayed transaction entry, by pressing the **F9** key. You can continue to press the **F9** key until no more transactions are retrieved.

If you wish to perform additional inquiry transactions of the same type, but using different customer accounts, you can press the **F7** key to redisplay the Transaction Selection screen. You can then choose the same transaction with different account types.

From this screen, you can also change customers, change transactions, or cancel the inquiry transaction by pressing the appropriate function key.

Note: To cancel an inquiry transaction, the customer's financial institution must allow nonfinancial transactions to be canceled.

A sample of the Last Transaction Response (one-sided) screen 1 is provided on the following page, followed by descriptions of its fields. Refer to section 7 for descriptions of fields from the corresponding Authorization Request screen on which the transaction was requested. In this sample, Authorization Request screen 1 (check clearance inquiry) is shown.

```
BASE24-CORE  CUSTOMER SERVICE          LLLL          YY/MM/DD  hh:mm  01 OF 01
```

```
      BANK:                                CUSTOMER ID:

```

```
      FILE DESTINATION:
```

```
F2-CHANGE CUSTOMER      F4-TRANSACTION MENU      F6-CANCEL
F7-CHANGE ACCT          F9-MORE INFO              F12-HELP
```

ACTION CODE — A code indicating the processing outcome of the inquiry transaction. An action code of 000 indicates an approved response.

A text description is displayed to the right of the code.

Refer to the *BASE24 Remote Banking Transaction Processing Manual* for descriptions of all possible action codes.

Field Length: System-protected

Data Name: Not applicable

APPROVAL CODE — The approval code assigned to the transaction by the transaction authorizer. An approval code is a random number generated only when a transaction is approved.

Field Length: System-protected

Data Name: Not applicable

DATE POSTED — The date, in YYMMDD format, this inquiry transaction was processed by a BASE24 product.

Field Length: System-protected
Data Name: Not applicable

DATE — The date, in YYMMDD format, the transaction described on the same line of the screen was posted.

Field Length: System-protected
Occurs: Up to 5 times
Data Name: THF.PRIKEY.DAT-TIM

AMOUNT — The amount of this particular transaction in whole and fractional currency units (for example, U.S. dollars and cents). A decimal point can be displayed if the amount contains fractional currency units.

Field Length: System-protected
Occurs: Up to 5 times
Data Name: THF.DETL.AMT

TYPE — A code indicating whether this transaction debited or credited the customer account. A transfer is either a debit or credit, depending on whether this transaction was performed on a *from* account or *to* account, respectively. Valid values are as follows:

CR = This transaction credited the customer account. This includes all transfers and deposits to this account.

DB = This transaction debited the customer account. This includes all checks, payments, withdrawals, and transfers from this account.

Field Length: System-protected
Occurs: Up to 5 times
Data Name: THF.ALT-KEY4.DB-CR-IND

SOURCE — A code indicating where this transaction originated. BASE24 reserved values are as follows:

- A = Automated teller machine (ATM)
- B = Remote banking device (for example, an interactive voice response system, personal computer, screen phone, customer service interface, third-party processor, kiosk, personal digital assistant, or the Internet)
- P = Point-of-sale (POS) device
- T = Teller device

Field Length: System-protected
Occurs: Up to 5 times
Data Name: THF.ALT-KEY2.SRC

CHEQUE — The number of a check for this transaction. If a check is not involved in this transaction, this field is blank.

Field Length: System-protected
Occurs: Up to 5 times
Data Name: THF.ALT-KEY1.CHQ-NUM

FUNDS — A code that indicates whether the account had sufficient funds to approve this transaction. Valid values are as follows:

- N = Sufficient funds were not available to approve this transaction.
- ␣ = Sufficient funds were available to approve this transaction.

Field Length: System-protected
Occurs: Up to 5 times
Data Name: THF.DETL.TXN-FLG

RVSL — A code that indicates whether this transaction is a reversal. Valid values are as follows:

- R = Yes, this transaction is a reversal.
- ␣ = No, this transaction is not a reversal.

Field Length: System-protected
Occurs: Up to 5 times
Data Name: THF.DETL.TXN-FLG

HOST CODE — The code assigned to this transaction for processing on a host.
If a transaction is not processed on a host, this field is blank.

Field Length: System-protected
Occurs: Up to 5 times
Data Name: THF.DETL.HOST-TXN-CDE

ACI Worldwide Inc.

Section 23

Loan Application

The Loan Application screen is a BASE24-billpay screen that allows you to submit a loan application on behalf of a customer. Applications can be submitted both for currently configured customers and customers who have not yet been defined to the system. Thus, you can access this screen without performing customer verification.

The Loan Application screen is displayed when you select the Loan Application transaction (LOAN APPLICATION) from the Transaction Menu or press the **F7** key on the Customer Verify Request screen.

The Loan Application screen consists of six screens, each of which is described below. You can move among the screens using the **F9** and **F11** keys.

- Screen 1 defines the purpose and amount of the requested loan and provides personal applicant information.
- Screen 2 defines personal applicant information including current and previous employment and whether any legal actions have been taken against the customer.
- Screen 3 defines personal coapplicant information, including current and previous employment.
- Screen 4 lists current applicant assets.
- Screen 5 defines property asset information, including automobiles owned, home equity, and life insurance.
- Screen 6 defines current applicant liabilities.

The only required information on the Loan Application screen is the applicant name (Name field) and the loan amount requested (Amount Requested field) on screen 1.

After completing a loan application, press the **F5** key to submit it. A message is displayed indicating whether the request was successfully written to the Loan Table (LOAN). This table is used to generate the Loan Application Report, which is run automatically on a daily basis. This report can then be reviewed by qualified financial institution personnel.

Screen 1 Function Keys

The use of one function key on Loan Application screen 1 differs from that specified for the standard CSR function keys explained in section 1. The use of this function key is explained below.

The first column of information below shows the BASE24 key. The second column describes the function that can be accomplished with this function key.

Key	Description
F5	Submit Loan — Submits the loan application entered. A row for the loan application is created and inserted into the Loan Table (LOAN). Entries from this table are included in the Loan Application Report, which is run automatically on a daily basis.

Screen 1

Loan Application screen 1 allows you to enter the type and amount of the loan requested as well as personal applicant information. Loan Application screen 1 is shown below, followed by descriptions of its fields.

```

```

BANK — The name of the financial institution from which the customer is requesting a loan. A value is displayed in this field only if one was retrieved during customer verification processing.

Field Length: System-protected
 Column Name: BANK.BANK_NAME

NAME — The family name or last name of the customer, followed by the given name or first name of the customer and the customer's middle initial. These fields can contain the customer name obtained from the Customer Verify Response screen or be blank if you accessed this screen from the Customer Verify Request screen without entering a customer name or verifying the customer.

Field Length: System-protected
Required Field: Yes
Default Value: No default value
Column Names: PIT.NAM_FMLY
PIT.NAM_GIVEN
PIT.NAM_M_I

Loan Type — A user-defined code indicating the type of loan requested.

Field Length: 1 alphanumeric character
Required Field: No
Default Value: No default value
Column Name: LOAN.LOAN_TYP

Referred By

The following two fields provide the name of the person who referred this customer, if applicable.

Family — The family name or last name of the person who referred this customer, if applicable.

This field accepts special characters required for languages other than U.S. English.

Field Length: 1–20 alphanumeric or special characters
Required Field: No
Default Value: No default value
Column Name: LOAN.REFERBY_LAST_NAME

Given — The given name or first name of the person who referred this customer, if applicable.

This field accepts special characters required for languages other than U.S. English.

Field Length: 1–10 alphanumeric or special characters
Required Field: No
Default Value: No default value
Column Name: LOAN.REFERBY_FIRST_NAME

Amount Requested — The amount of the requested loan in whole and fractional currency units. A decimal point can be entered if the amount requested includes fractional currency units. A negative amount cannot be entered.

Field Length: 1–20 alphanumeric characters, with 19 numeric characters and 1 optional decimal point character
Required Field: Yes
Default Value: No default value
Column Name: LOAN.AMT

Collateral — Free-format text describing the collateral offered for this loan.

Field Length: 1–25 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: LOAN.COLLATERAL

Purpose of Loan — Free-format text describing the purpose for this loan.

Field Length: 1–60 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: LOAN.PURPOSE_OF_LOAN

Applicant Information

The following fields contain personal information for the loan applicant, including name, address, and personal identification information.

Name

The following three fields define the loan applicant's name. If the NAME fields at the top of the screen contain information when this screen is accessed, then these fields are automatically filled in with the same information.

Family — The family name or last name of the loan applicant.

This field accepts special characters required for languages other than U.S. English.

Field Length: 1–20 alphanumeric or special characters
Required Field: Yes
Default Value: No default value
Column Name: LOAN.LAST_NAME

Middle — The middle initial of the loan applicant.

This field accepts special characters required for languages other than U.S. English.

Field Length: 1 alphabetic character
Required Field: No
Default Value: No default value
Column Name: LOAN.MIDDLE_INITIAL

Given — The given name or first name of the loan applicant.

This field accepts special characters required for languages other than U.S. English.

Field Length: 1–10 alphanumeric or special characters
Required Field: Yes
Default Value: No default value
Column Name: LOAN.FIRST_NAME

Date of Birth — The birth date of the loan applicant.

The format in which the date in this field is entered and displayed (for example, YYYYMMDD) is displayed immediately to the right of the Date of Birth field value.

Field Length: 8 numeric characters
Required Field: No
Default Value: No default value
Column Name: LOAN.DOB

Government ID — The government ID (for example, U.S. social security number) assigned to the loan applicant.

Field Length: 1–15 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: LOAN.GOV_T_ID

Home Phone — The home telephone number for the loan applicant.

Field Length: 1–20 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: LOAN.HOME_PHN

Number of Dependents — The number of dependents for the loan applicant.

Field Length: 1–2 numeric characters
Required Field: Yes
Default Value: 0
Column Name: LOAN.NUM_DEPENDENTS

Ages — Free-form text identifying the ages of each dependent for the loan applicant.

Field Length: 1–30 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: LOAN.DEPENDENT_AGES

Married — A flag indicating whether the loan applicant is married. Valid values are as follows:

Y = Yes, the loan applicant is married.
N = No, the loan applicant is not married.

Field Length: 1 alphabetic character
Required Field: Yes
Default Value: N
Column Name: LOAN.MARRIED

Current Address

The following nine fields contain information regarding the loan applicant's current residence.

L1 — The first line of the street or mailing address for the loan applicant's current residence.

Field Length: 1–30 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: LOAN.CUR_ADDR_1

L2 — The second line of the street or mailing address for the loan applicant's current residence.

Field Length: 1–30 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: LOAN.CUR_ADDR_2

City — The name of the city where the loan applicant currently resides.

Field Length: 1–25 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: LOAN.CUR_CITY

ST — The two-letter U.S. state or Canadian province abbreviation for the loan applicant's current residence. Reserved state codes are defined in the 1988 ANSI X3.38 standard, *Identification of the States, the District of Columbia, and the Outlying and Associated Areas of the United States for Information Interchange*.

Field Length: 2 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: LOAN.CUR_ST

PCde — The postal code of the loan applicant's current residence.

Field Length: 1–10 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: LOAN.CUR_POSTAL_CODE

Years at Address — The number of years the loan applicant has resided at his or her current address.

Field Length: 1–2 numeric characters
Required Field: Yes
Default Value: 0
Column Name: LOAN.YEARS_AT_CUR_ADDR

Own — A flag indicating whether the loan applicant owns his or her current residence. Valid values are as follows:

Y = Yes, this customer owns his or her current residence.

N = No, this customer does not own his or her current residence.

Field Length: 1 alphabetic character
Required Field: Yes
Default Value: N
Column Name: LOAN.OWN_CUR_ADDR

Monthly Payment — The amount, in whole and fractional currency units, of the monthly mortgage or rent payment for the loan applicant's current residence. A decimal point can be entered if the payment includes fractional currency units.

Field Length: 1–20 alphanumeric characters, with 19 numeric characters and 1 optional decimal point character
Required Field: No
Default Value: No default value
Column Name: LOAN.MONTHLY_PMT

Rent Payments are made to — The company or person to which the loan applicant makes rent payments, if the applicant rents his or her current residence.

Field Length: 1–20 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: LOAN.RENT_PMT_TO

Previous

The following seven fields contain information regarding the loan applicant's previous residence.

L1 — The first line of the street or mailing address for the loan applicant's previous residence.

Field Length: 1–30 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: LOAN.PREV_ADDR_1

L2 — The second line of the street or mailing address for the loan applicant's previous residence.

Field Length: 1–30 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: LOAN.PREV_ADDR_2

City — The name of the city for the loan applicant's previous residence.

Field Length: 1–25 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: LOAN.PREV_CITY

ST — The two-letter U.S. state or Canadian province abbreviation for the loan applicant's previous residence. Reserved state codes are defined in the 1988 ANSI X3.38 standard, *Identification of the States, the District of Columbia, and the Outlying and Associated Areas of the United States for Information Interchange*.

Field Length: 2 alphanumeric characters
 Required Field: No
 Default Value: No default value
 Column Name: LOAN.PREV_ST

PCde — The postal code of the loan applicant's previous residence.

Field Length: 1–10 alphanumeric characters
 Required Field: No
 Default Value: 0
 Column Name: LOAN.PREV_POSTAL_CODE

Years at Address — The number of years the loan applicant resided at his or her previous address.

Field Length: 1–2 numeric characters
 Required Field: Yes
 Default Value: 0
 Column Name: LOAN.YEARS_AT_PREV_ADDR

Own — A flag indicating whether the loan applicant owned his or her previous residence. Valid values are as follows:

Y = Yes, the loan applicant owned his or her previous residence.
 N = No, the loan applicant did not own his or her previous residence.

Field Length: 1 alphabetic character
 Required Field: Yes
 Default Value: N
 Column Name: LOAN.OWN_PREV_ADDR

Screen 2 Function Keys

The use of one function key on Loan Application screen 2 differs from that specified for the standard CSR function keys explained in section 1. The use of this function key is explained below.

The first column of information below shows the BASE24 key. The second column describes the function that can be accomplished with this function key.

Key	Description
F5	Submit Loan — Submits the loan application entered. A row for the loan application is created and inserted into the Loan Table (LOAN). Entries from this table are included in the Loan Application Report, which is run automatically on a daily basis.

Screen 2

Loan Application screen 2 allows you to enter the loan applicant's employment history and indicate whether any monetary legal actions have been taken against the applicant. Loan Application screen 2 is shown below, followed by descriptions of its fields.

```

BASE24-CORE  LOAN APPLICATION          LLLL          YY/MM/DD  hh:mm   2 OF  6

Occupation — A description of the loan applicant's current occupation.

Field Length: 1–20 alphanumeric characters
 Required Field: No
 Default Value: No default value
 Column Name: LOAN.OCCUPATION

Current Employer

The following eight fields contain information regarding the loan applicant's current employer.

Name — The name of the loan applicant's current employer.

Field Length: 1–22 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: LOAN.CUR_EMP

Addr — The first line of the street or mailing address for the loan applicant's current employer.

Field Length: 1–30 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: LOAN.CUR_EMP_ADDR_1

L2 — The second line of the street or mailing address for the loan applicant's current employer.

Field Length: 1–30 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: LOAN.CUR_EMP_ADDR_2

City — The name of the city for the loan applicant's current employer.

Field Length: 1–25 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: LOAN.CUR_EMP_CITY

ST — The two-letter U.S. state or Canadian province abbreviation for the loan applicant's current employer. Reserved state codes are defined in the 1988 ANSI X3.38 standard, *Identification of the States, the District of Columbia, and the Outlying and Associated Areas of the United States for Information Interchange*.

Field Length: 2 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: LOAN.CUR_EMP_ST

PCde — The postal code for the loan applicant's current employer.

Field Length: 1–10 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: LOAN.CUR_EMP_POSTAL_CODE

Years — The number of years this loan applicant has worked for his or her current employer.

Field Length: 1–2 numeric characters
Required Field: Yes
Default Value: 0
Column Name: LOAN.YEARS_AT_CUR_EMP

Monthly Income — The amount, in whole and fractional currency units, the loan applicant makes per month in his or her current job. This field cannot contain a negative amount.

Field Length: 1–20 alphanumeric characters, with 19 numeric characters and 1 optional decimal point character
Required Field: No
Default Value: No default value
Column Name: LOAN.CUR_MONTH_INCOME

Previous

The following eight fields contain information regarding the loan applicant's previous employer.

Name — The name of the loan applicant's previous employer.

Field Length: 1–22 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: LOAN.PREV_EMP

Addr — The first line of the street or mailing address for the loan applicant's previous employer.

Field Length: 1–30 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: LOAN.PREV_EMP_ADDR_1

L2 — The second line of the street or mailing address for the loan applicant's previous employer.

Field Length: 1–30 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: LOAN.PREV_EMP_ADDR_2

City — The name of the city for the loan applicant's previous employer.

Field Length: 1–25 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: LOAN.PREV_EMP_CITY

ST — The two-letter U.S. state or Canadian province abbreviation for the loan applicant's previous employer. Reserved state codes are defined in the 1988 ANSI X3.38 standard, *Identification of the States, the District of Columbia, and the Outlying and Associated Areas of the United States for Information Interchange*.

Field Length: 2 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: LOAN.PREV_EMP_ST

PCde — The postal code for the loan applicant's previous employer.

Field Length: 1–10 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: LOAN.PREV_EMP_POSTAL_CODE

Years — The number of years the loan applicant worked for his or her previous employer.

Field Length: 1–2 numeric characters
Required Field: Yes
Default Value: 0
Column Name: LOAN.YEARS_AT_PREV_EMP

Monthly Income — The amount, in whole and fractional currency units, the loan applicant made per month in his or her previous job.

Field Length: 1–20 alphanumeric characters, with 19 numeric characters and 1 optional decimal point character
Required Field: No
Default Value: No default value
Column Name: LOAN.PREV_MONTH_INCOME

Other Source of Income — Any other source from which the loan applicant currently derives income besides his or her current job.

Field Length: 1–20 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: LOAN.OTHER_INCOME_SRC

Amount — The amount, in whole and fractional currency units, the loan applicant currently derives per month from a source other than his or her current job.

Field Length: 1–20 alphanumeric characters, with 19 numeric characters and 1 optional decimal point character
Required Field: No
Default Value: No default value
Column Name: LOAN.OTHER_INCOME_AMT

Judgements — A flag indicating whether the loan applicant has ever had a legal ruling or judgement against him or her. Valid values are as follows:

Y = Yes, the loan applicant has had a legal ruling or judgement against him or her.
N = No, the loan applicant has never had a legal ruling against him or her.

Field Length: 1 alphabetic character
Required Field: Yes
Default Value: N
Column Name: LOAN.JUDGEMENTS

Bankruptcy — A flag indicating whether the loan applicant has ever declared a personal bankruptcy. Valid values are as follows:

Y = Yes, the loan applicant has declared a personal bankruptcy.
N = No, the loan applicant has never declared a personal bankruptcy.

Field Length: 1 alphabetic character
Required Field: Yes
Default Value: N
Column Name: LOAN.BANKRUPTCY

Back Taxes — A flag indicating whether the loan applicant has ever owed any back taxes. Valid values are as follows:

Y = Yes, the loan applicant has owed back taxes.

N = No, the loan applicant has never owed any back taxes.

Field Length: 1 alphabetic character

Required Field: Yes

Default Value: N

Column Name: LOAN.BACK_TAXES

Income Reduction — A flag indicating whether the loan applicant has ever had any income reductions (for example, automatic deductions for child support or alimony payments) as a result of a legal ruling or judgement. Valid values are as follows:

Y = Yes, the loan applicant has had an income reduction.

N = No, the loan applicant has never had an income reduction.

Field Length: 1 alphabetic character

Required Field: Yes

Default Value: N

Column Name: LOAN.INCOME_REDUCTION

Screen 3 Function Keys

The use of one function key on Loan Application screen 3 differs from that specified for the standard CSR function keys explained in section 1. The use of this function key is explained below.

The first column of information below shows the BASE24 key. The second column describes the function that can be accomplished with this function key.

Coapplicant Information

The following fields contain personal and employment history information for a coapplicant of the requested loan.

Name

The following three fields define the loan coapplicant's name.

Family — The family name or last name of the coapplicant for this loan.

This field accepts special characters required for languages other than U.S. English.

Field Length: 1–20 alphanumeric or special characters
Required Field: No
Default Value: No default value
Column Name: LOAN.COAP_LAST_NAME

Middle — The middle initial of the coapplicant for this loan.

This field accepts special characters required for languages other than U.S. English.

Field Length: 1 alphabetic character
Required Field: No
Default Value: No default value
Column Name: LOAN.COAP_MIDDLE_INITIAL

Given — The given name or first name of the coapplicant for this loan.

This field accepts special characters required for languages other than U.S. English.

Field Length: 1–10 alphanumeric or special characters
Required Field: No
Default Value: No default value
Column Name: LOAN.COAP_FIRST_NAME

Date of Birth — The birth date of the coapplicant for this loan.

The format in which the date in this field is entered and displayed (for example, YYYYMMDD) is displayed immediately to the right of the Date of Birth field value.

Field Length: 8 numeric characters
Required Field: No
Default Value: No default value
Column Name: LOAN.COAP_DOB

Government ID — The government ID (for example, U.S. social security number) assigned to the coapplicant for this loan.

Field Length: 1–15 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: LOAN.COAP_GOV_T_ID

Home Phone — The home telephone number of the coapplicant for this loan.

Field Length: 1–20 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: LOAN.COAP_HOME_PHN

Relationship — The relationship of the coapplicant to the customer requesting the loan.

Field Length: 1–10 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: LOAN.COAP_RELATIONSHIP

Occupation — A description of the coapplicant's current occupation.

Field Length: 1–20 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: LOAN.COAP_OCCUPATION

Current Employer

The following eight fields contain information regarding the coapplicant's current employer.

Name — The name of the coapplicant's current employer.

Field Length: 1–22 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: LOAN.COAP_CUR_EMP

Addr — The first line of the street or mailing address for the coapplicant's current employer.

Field Length: 1–30 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: LOAN.COAP_CUR_EMP_ADDR_1

L2 — The second line of the street or mailing address for the coapplicant's current employer.

Field Length: 1–30 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: LOAN.COAP_CUR_EMP_ADDR_2

City — The name of the city for the coapplicant's current employer.

Field Length: 1–25 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: LOAN.COAP_CUR_EMP_CITY

ST — The two-letter U.S. state or Canadian province abbreviation for the coapplicant's current employer. Reserved state codes are defined in the 1988 ANSI X3.38 standard, *Identification of the States, the District of Columbia, and the Outlying and Associated Areas of the United States for Information Interchange*.

Field Length: 2 alphanumeric characters
 Required Field: No
 Default Value: No default value
 Column Name: LOAN.COAP_CUR_EMP_ST

PCde — The postal code for the coapplicant's current employer.

Field Length: 1–10 alphanumeric characters
 Required Field: No
 Default Value: No default value
 Column Name: LOAN.COAP_CUR_EMP_POSTAL_CODE

Years — The number of years the coapplicant has worked for his or her current employer.

Field Length: 1–2 numeric characters
 Required Field: Yes
 Default Value: 0
 Column Name: LOAN.COAP_YEARS_AT_CUR_EMP

Monthly Income — The amount, in whole and fractional currency units, the coapplicant makes per month in his or her current job. A negative amount cannot be entered in this field.

Field Length: 1–20 alphanumeric characters, with 19 numeric characters and 1 optional decimal point character
 Required Field: No
 Default Value: No default value
 Column Name: LOAN.COAP_CUR_MONTH_INCOME

Previous

The following eight fields contain information regarding the coapplicant's previous employer.

Name — The name of the coapplicant's previous employer.

Field Length: 1–22 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: LOAN.COAP_PREV_EMP

Addr — The first line of the street or mailing address for the coapplicant's previous employer.

Field Length: 1–30 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: LOAN.COAP_PREV_EMP_ADDR_1

L2 — The second line of the street or mailing address for the coapplicant's previous employer.

Field Length: 1–30 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: LOAN.COAP_PREV_EMP_ADDR_2

City — The name of the city for the coapplicant's previous employer.

Field Length: 1–25 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: LOAN.COAP_PREV_EMP_CITY

ST — The two-letter U.S. state or Canadian province abbreviation for the coapplicant's previous employer. Reserved state codes are defined in the 1988 ANSI X3.38 standard, *Identification of the States, the District of Columbia, and the Outlying and Associated Areas of the United States for Information Interchange*.

Field Length: 2 alphanumeric characters
 Required Field: No
 Default Value: No default value
 Column Name: LOAN.COAP_PREV_EMP_ST

PCde — The postal code for the coapplicant's previous employer.

Field Length: 1–10 alphanumeric characters
 Required Field: No
 Default Value: No default value
 Column Name: LOAN.COAP_PREV_EMP_POSTAL_CODE

Years — The number of years this coapplicant worked for his or her previous employer.

Field Length: 1–2 numeric characters
 Required Field: Yes
 Default Value: 0
 Column Name: LOAN.COAP_YEARS_AT_PREV_EMP

Monthly Income — The amount, in whole and fractional currency units, the coapplicant made per month in his or her previous job. This field cannot contain a negative amount.

Field Length: 1–20 alphanumeric characters, with 19 numeric characters and 1 optional decimal point character
 Required Field: No
 Default Value: No default value
 Column Name: LOAN.COAP_PREV_MONTH_INCOME

Other Source of Income — Any other source from which the coapplicant currently derives income besides his or her current job.

Field Length: 1–20 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: LOAN.COAP_OTHER_INCOME_SRC

Amount — The amount, in whole and fractional currency units, the coapplicant currently derives per month from a source other than his or her current job. This field cannot contain a negative amount.

Field Length: 1–20 alphanumeric characters, with 19 numeric characters and 1 optional decimal point character
Required Field: No
Default Value: No default value
Column Name: LOAN.COAP_OTHER_INCOME_AMT

Screen 4 Function Keys

The use of one function key on Loan Application screen 4 differs from that specified for the standard CSR function keys explained in section 1. The use of this function key is explained below.

The first column of information below shows the BASE24 key. The second column describes the function that can be accomplished with this function key.

Key	Description
F5	Submit Loan — Submits the loan application entered. A row for the loan application is created and inserted into the Loan Table (LOAN). Entries from this table are included in the Loan Application Report, which is run automatically on a daily basis.

Assets

The following fields define the current asset accounts for the loan applicant.

Institution

The following fields provide the name and address of financial institutions where the loan applicant maintains an account (for example, savings or demand deposit) considered to be an asset. Three sets of these fields are provided for defining up to three asset accounts on behalf of the applicant.

NAME — The name of the financial institution.

Field Length: 1–22 alphanumeric characters each
Occurs: Up to 3 times
Required Field: No
Default Value: No default value
Column Names: LOAN.ASSETS_INST_NAME_1
LOAN.ASSETS_INST_NAME_2
LOAN.ASSETS_INST_NAME_3

Addr — The first line of the street or mailing address for the financial institution.

Field Length: 1–30 alphanumeric characters each
Occurs: Up to 3 times
Required Field: No
Default Value: No default value
Column Names: LOAN.ASSETS_ADDR_1_1
LOAN.ASSETS_ADDR_1_2
LOAN.ASSETS_ADDR_1_3

<addr12> — The second line of the street or mailing address for the financial institution.

Field Length: 1–30 alphanumeric characters each
Occurs: Up to 3 times
Required Field: No
Default Value: No default value
Column Names: LOAN.ASSETS_ADDR_2_1
LOAN.ASSETS_ADDR_2_2
LOAN.ASSETS_ADDR_2_3

City — The name of the city where this financial institution is located.

Field Length: 1–25 alphanumeric characters each
Occurs: Up to 3 times
Required Field: No
Default Value: No default value
Column Names: LOAN.ASSETS_CITY_1
LOAN.ASSETS_CITY_2
LOAN.ASSETS_CITY_3

ST — The two-letter U.S. state or Canadian province abbreviation for the state where this financial institution is located. Reserved state codes are defined in the 1988 ANSI X3.38 standard, *Identification of the States, the District of Columbia, and the Outlying and Associated Areas of the United States for Information Interchange*.

Field Length: 2 alphanumeric characters each
Occurs: Up to 3 times
Required Field: No
Default Value: No default value
Column Names: LOAN.ASSETS_ST_1
LOAN.ASSETS_ST_2
LOAN.ASSETS_ST_3

PCde — The postal code for this financial institution.

Field Length: 1–10 alphanumeric characters each
Occurs: Up to 3 times
Required Field: No
Default Value: No default value
Column Names: LOAN.ASSETS_POSTAL_CODE_1
LOAN.ASSETS_POSTAL_CODE_2
LOAN.ASSETS_POSTAL_CODE_3

Account — The number of the account at the financial institution.

Field Length: 1–20 alphanumeric characters each
Occurs: Up to 3 times
Required Field: No
Default Value: No default value
Column Names: LOAN.ASSETS_ACCT_NUM_1
LOAN.ASSETS_ACCT_NUM_2
LOAN.ASSETS_ACCT_NUM_3

Type — A user-defined code indicating the type of the account.

Field Length: 2 alphanumeric characters each
Occurs: Up to 3 times
Required Field: No
Default Value: No default value
Column Names: LOAN.ASSETS_ACCT_TYP_1
LOAN.ASSETS_ACCT_TYP_2
LOAN.ASSETS_ACCT_TYP_3

Value — The estimated current value, in whole and fractional currency units, of the account. This field cannot contain a negative amount.

Field Length: 3 fields of 1–20 alphanumeric characters, with 19 numeric characters and 1 optional decimal point character each
Required Field: No
Default Value: No default value
Column Names: LOAN.ASSETS_ACCT_VALUE_1
LOAN.ASSETS_ACCT_VALUE_2
LOAN.ASSETS_ACCT_VALUE_3

Screen 5 Function Keys

The use of one function key on Loan Application screen 5 differs from that specified for the standard CSR function keys explained in section 1. The use of this function key is explained below.

The first column of information below shows the BASE24 key. The second column describes the function that can be accomplished with this function key.

Key	Description
F5	Submit Loan — Submits the loan application entered. A row for the loan application is created and inserted into the Loan Table (LOAN). Entries from this table are included in the Loan Application Report, which is run automatically on a daily basis.

Screen 5

Loan Application screen 5 allows you to enter additional applicant asset information. Loan Application screen 5 is shown below, followed by descriptions of its fields.

Auto 1

The following three fields describe an automobile owned by the applicant requesting the loan.

Year — The model year, in YYYY format, of the automobile.

- Field Length: 4 numeric characters
- Required Field: No
- Default Value: No default value
- Column Name: LOAN.AUTO_YR_1

Make — The make, or manufacturer, of the automobile.

Field Length: 1–20 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: LOAN.AUTO_MAKE_1

Model — The model name of the automobile.

Field Length: 1–20 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: LOAN.AUTO_MODEL_1

Auto 2

The following three fields describe a second automobile owned by the applicant requesting the loan.

Year — The model year, in YYYY format, of the automobile.

Field Length: 4 numeric characters
Required Field: No
Default Value: No default value
Column Name: LOAN.AUTO_YR_2

Make — The make, or manufacturer, of the automobile.

Field Length: 1–20 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: LOAN.AUTO_MAKE_2

Model — The model name of the automobile.

Field Length: 1–20 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: LOAN.AUTO_MODEL_2

Residence Purchase Price — If the applicant requesting the loan owns his or her current residence, this is the amount, in whole and fractional currency units, the applicant paid for the property. This field cannot contain a negative amount.

Field Length: 1–20 alphanumeric characters, with 19 numeric characters and 1 optional decimal point character
 Required Field: No
 Default Value: No default value
 Column Name: LOAN.RESIDENCE_PURCH_PRICE

Down Payment — The amount, in whole and fractional currency units, the applicant paid as a down payment for this residence. This field cannot contain a negative amount.

Field Length: 1–20 alphanumeric characters, with 19 numeric characters and 1 optional decimal point character
 Required Field: No
 Default Value: No default value
 Column Name: LOAN.DOWN_PMT

Life Insurance Value — The value, in whole and fractional currency units, of life insurance policies owned by the loan applicant. This field cannot contain a negative amount.

Field Length: 1–20 alphanumeric characters, with 19 numeric characters and 1 optional decimal point character
 Required Field: No
 Default Value: No default value
 Column Name: LOAN.LIFE_INSURANCE_VALUE

Other Property — A flag indicating whether the loan applicant owns any property other than his or her current residence. Valid values are as follows:

Y = Yes, the loan applicant owns additional property.

N = No, the loan applicant does not own any additional property.

Field Length: 1 alphabetic character
 Required Field: Yes
 Default Value: N
 Column Name: LOAN.OTHER_PROPERTY

<Other property descrip> — A description of property owned by the loan applicant other than his or her current residence.

Field Length: 1–30 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: LOAN.OTHER_PROPERTY_DESC

Other Assets — A flag indicating whether the loan applicant has any assets other than those already described. Valid values are as follows:

Y = Yes, the loan applicant has other assets.

N = No, the loan applicant does not have any other assets.

Field Length: 1 alphabetic character
Required Field: Yes
Default Value: N
Column Name: LOAN.OTHER_ASSETS

<Other assets descrip> — A description of assets owned by the loan applicant other than those already described.

Field Length: 1–30 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: LOAN.OTHER_ASSETS_DESC

Screen 6 Function Keys

The use of one function key on Loan Application screen 6 differs from that specified for the standard CSR function keys explained in section 1. The use of this function key is explained below.

The first column of information below shows the BASE24 key. The second column describes the function that can be accomplished with this function key.

Section 24

Miscellaneous Request

The Miscellaneous Request screen is a BASE24-billpay screen that allows you to enter customer questions, complaints or account maintenance requests that fall outside the scope of BASE24-billpay customer service.

On this screen you enter an optional contact phone number and the details of the call. You also specify the type of contact (that is, financial institution, customer, vendor, or other), the priority of the request, the type of request (that is, complaint, query, or account maintenance), and, optionally, the name of the department to handle the request. All requests are entered on behalf of the customer ID currently selected during customer verification processing.

After entering the above information, you can submit the request by pressing the **F5** key. A message is displayed on the screen indicating whether the request was successfully submitted. When the request is successfully submitted, the system automatically records the date and time of the request as well as your user logon ID. The request is written to the Miscellaneous Request Table (MISC) and the request is written to the History Table. This table is used to generate the Miscellaneous Request Report, which is run automatically on a daily basis. This report can then be reviewed by the appropriate personnel.

From this screen, you can also inquire upon previously submitted requests by pressing the **Shift-F6** and **Shift-F7** keys. The **Shift-F6** keys display the most recent request submitted on behalf of the customer (that is, customer ID). The **Shift-F7** keys display the next most current request submitted before the currently displayed request. Using the **Shift-F6** and **Shift-F7** keys you can peruse requests according to the order in which they were entered chronologically, starting with the most recent request and moving backwards in time.

You can access the Miscellaneous Request screen by selecting the Miscellaneous Request transaction on the Transaction Menu, or by pressing the **F13** key on the Customer Information screen.

From the Miscellaneous Request screen, you can access the Customer Verify Request screen or the Transaction Menu by pressing the **F2** or **F4** keys, respectively.

Screen 1 Function Keys

The use of three function keys on Miscellaneous Request screen 1 differs from that specified for the standard CSR function keys explained in section 1. The use of these function keys is explained below.

The first column of information below shows the BASE24 keys. The second column describes the functions that can be accomplished with these function keys.

Key	Description
F5	Submit Request — Writes the currently displayed request to a row in the Miscellaneous Request Table and is written to the History Table.
Shift-F6	Most Recent — Displays the most recent request submitted.
Shift-F7	Previous — Displays the next most current request submitted before the currently displayed request.

Screen 1

Miscellaneous Request screen 1 allows you to enter and view miscellaneous customer requests. Miscellaneous Request screen 1 is shown below, followed by descriptions of its fields.

BANK — The name of the customer's financial institution. The value in this field was retrieved during customer verification processing.

Field Length:	System-protected
Column Name:	BANK.BANK NAME

CUSTOMER ID — The unique identification number assigned to the customer. The value in this field was retrieved during customer verification processing.

Field Length: System-protected
Column Name: CSTT.PAN

ACCT NUMBER — An application account number for this customer. An account number is displayed in this field only if one was entered and retrieved during customer verification processing. Otherwise, this field is blank.

Field Length: System-protected
Column Name: CACT.ACCT

NAME — The customer's family name or last name, followed by the customer's given name or first name, and the customer's middle initial. The name displayed in these fields was retrieved during customer verification processing.

Field Length: System-protected
Column Names: PIT.NAM_FMLY
PIT.NAM_GIVEN
PIT.NAM_M_I

Phone — The telephone number of the contact person for this request.

Field Length: 1–20 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: MISC.PHN

Contact Type — A code indicating the type of contact for this request. Reserved values are as follows:

B = Bank (financial institution)
C = Customer
O = Other
V = Vendor

This field may also contain a user-defined contact type.

Field Length: 1 alphabetic character
Required Field: Yes
Default Value: No default value
Column Name: MISC.CONTACT_TYP

Priority — The priority assigned to this request. Requests with a priority of 1 are considered the highest priority while requests with a priority of 5 are considered the lowest priority. Valid values are 1–5.

Field Length: 1 numeric character
Required Field: Yes
Default Value: 5
Column Name: MISC.PRI

Type — A code indicating the type of this request. Valid values are as follows:

A = Account maintenance
C = Complaint
Q = Question or query

User-defined values can be used for other requests.

Field Length: 1 alphanumeric character
Required Field: No
Default Value: No default value
Column Name: MISC.TYP

Department — User-defined text identifying the financial institution or service provider department to manage this request.

Field Length: 1–15 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: MISC.DEPARTMENT

Contact Details — User-defined text explaining the details of this request. Text automatically wraps from one line to the next.

Field Length: 8 lines with 78 alphanumeric characters per line
Required Field: Yes
Default Value: No default value
Column Name: MISC.DETAILS

Date Entered — The date this request was entered.

The format in which the date in this field is entered and displayed (for example, YYYYMMDD) is displayed immediately to the right of the Date Entered field value.

Field Length: System-protected
Column Name: MISC.TXN_SRC_LCT

By User — The group number and user number assigned to the person who entered this request. For more information on group and user numbers, refer to the *BASE24 CRT Access Manual*. This field actually consists of two subfields, each of which is described below.

The first subfield contains the group number of the person who entered this request.

Field Length: System-protected
Column Name: MISC.LAST_FM_GRP_NUM

The second subfield contains the user number of the person who entered this request.

Field Length: System-protected
Column Name: MISC.LAST_FM_USER_NUM

ACI Worldwide Inc.

Section 25

Multiple Customer Selection

The Multiple Customer Selection screen is a BASE24-telebanking screen displayed when you press the **F2** key on the Customer Verify Request screen and one or more of the following situations exist:

- The entered customer ID can be accessed by more than one customer.
- The entered full or partial customer name exactly matches or is similar in spelling to one or more customers configured to the system. This can only occur if a name token algorithm (for example, Soundex) is being used in your system.

The Multiple Customer Selection screen displays individual customer and customer ID combinations that match one or more of the above situations.

The Multiple Customer Selection screen is used by both the BASE24-billpay and BASE24-telebanking products to select among multiple customers.

You can scroll through the list of customer and customer ID combinations using the **F9** key. Up to six customer and customer ID combinations can be displayed on the screen at one time.

Addresses and home telephone numbers are provided for each customer and customer ID combination to help you differentiate between two or more customers with the exact same name. When you find the appropriate customer and customer ID combination to be used for this session, place the cursor next to the entry and select it by pressing the **F1** key. The Customer Verify Response screen is displayed. You can then continue customer verification processing on this screen.

If you cannot find the particular customer you are looking for on this screen, you can redisplay the Customer Verify Request screen by pressing the **F2** key.

Screen 1 Function Keys

The use of two function keys on Multiple Customer Selection screen 1 differs from that specified for the standard CSR function keys explained in section 1. The use of these function keys is explained below.

The first column of information below shows the BASE24 keys. The second column describes the functions that can be accomplished with these function keys.

Key	Description
F1	Select Customer — Selects the customer and customer ID combination displayed on the same line of the screen and displays the Customer Verify Response screen.
F9	More Customers — Displays the next six customer and customer ID combinations for the entered customer name or customer ID. This function is only valid when a message indicating that more customers are available is displayed.

Screen 1

Multiple Customer Selection screen 1 enables you to select a particular customer and customer ID combination to be verified and used for the current session with a customer. Multiple Customer Selection screen 1 is shown below, followed by descriptions of its fields.

Field Length: System-protected
Occurs: Up to six times
Column Name: PIT.STR_ADDR_1

PERSONAL ID — The identifier for this customer's information in the Personal Information Table (PIT). The identifier can be prescribed by the service provider, chosen by the customer, or generated by the system, and must be unique within the PIT.

Field Length: System-protected
Occurs: Up to six times
Column Name: CPIT.PRSNL_ID

Section 26

New Payment

The New Payment screen is a BASE24-billpay screen that allows you to schedule immediate, future, and recurring payments.

Note: Transfers between accounts owned by two different financial institutions can only be handled as payments. In this case, the financial institution owning the *to* account must be configured as the vendor to receive the payment and the *to* account must be configured as the account with vendor.

You can access the New Payment screen by selecting any of the following transactions from the Transaction Menu:

- SCHEDULE PAYMENT – IMMEDIATE
- SCHEDULE PAYMENT – FUTURE
- SCHEDULE PAYMENT – RECURRING

You can also access the New Payment screen by pressing the **Shift-F1** keys on the Customer Information screen, Customer Vendor Detail screen, or Scheduled Transactions screen.

The value in the Payment Type field defaults to the type selected (immediate, future, or recurring) when you access the screen. For each payment scheduled, valid values must be displayed in each of the following fields:

- CustVend Number
- Cust From Account
- Transaction Amount
- First Payment Date (if the Payment Type field is set to the value F or R)
- Vend Specific Data (if the Vend Specific Desc field displays a value)

- Total Number of Payments to Make (if the Payment Type field is set to the value R)
- Recurring Period (if the Payment Type field is set to the value R)

If the customer does not know the account number from which the payment is to be withdrawn (Cust From Acct), you can display all accounts defined for the customer on the Account List screen by pressing the **Shift-F4** keys. You can then select an individual account on this screen to be returned and displayed in the Cust From Acct field on the New Payment screen by pressing the **F1** key.

You select the customer vendor to receive the payment from a list on the Customer Vendor List screen by pressing the **Shift-F5** keys. After selecting and returning an individual customer vendor on this screen, customer vendor information is displayed in the CustVend Number, Vendor Name, and Acct With Vendor fields on the New Payment screen.

After you have entered all the appropriate information for the type of payment to be made, press the **F5** key to enter the payment. The system validates the payment request, approves or denies the transaction, and displays the appropriate response information on the screen.

For immediate scheduled payments and denied future and recurring scheduled payments, the immediate response version of the New Payment screen is displayed. For approved future and recurring scheduled payment transactions, the Scheduled Payment Detail screen is displayed.

You can cancel approved immediate payments by pressing the **F6** key before you exit the New Payment screen as long as the Remittance Generator process has not yet processed the entry for the transaction in the Billpay History Table (HIST). A configurable system parameter indicates how old a HIST entry must be before it is processed by the Remittance Generator process. The default value for this parameter is 15 minutes. Your supervisor should be able to tell how this parameter is set for your system.

For approved future and recurring scheduled payments, you can update some transaction data using the Change Tran fields displayed near the bottom of the Scheduled Payment Detail screen. You can also delete the scheduled transaction or skip the next payment period on this screen.

After making an immediate scheduled payment or attempting a future or recurring scheduled payment that was denied, you press the **F1** key to clear the screen if more payments need to be made for this customer.

Refer to section 3 of this manual for detailed step-by-step instructions for entering immediate, future, and recurring scheduled payments. The validation criteria required for each payment transaction is discussed on the following pages.

Payment Validation

The following validation processing is performed by the system for each submitted payment transaction. The transaction must pass all these validation checks before it can be authorized.

1. The Verfd field for the vendor on the Vendor Registry screen must be set to the value VERIFIED.
2. The value in the First Payment Date field on the New Payment screen must be greater than or equal to the value in the Start Date field and less than or equal to the value in the End Date field for the customer on the Customer Information screen.
3. The value in the First Payment Date field on the New Payment screen must be greater than or equal to the begin date and less than or equal to the end date for the vendor in the Date Range fields on the Vendor Registry screen.
4. The account with vendor status for the customer vendor must be set to the value VERIFIED in the Status field on the Customer Vendor List or the Verify Status field on the Customer Vendor Detail screen.
5. The value in the First Payment Date field on the New Payment screen must be greater than or equal to the value in the Account: Begin Date field and less than or equal to the value in the Account: End Date field for the customer vendor on the Customer Vendor Detail screen.
6. The value in the First Payment Date field on the New Payment screen must be greater than or equal to the current business date.
7. The account specified in the Cust From Acct field must allow debit transactions and have a status that allows payments.
8. The transaction amount entered in the Transaction Amount field must be less than or equal to the following:
 - A nonzero value for the customer's BASE24-billpay transaction limit, regardless of the financial institution's BASE24-billpay transaction limit.
 - A nonzero value for the financial institution's BASE24-billpay transaction limit, if the customer's BASE24-billpay transaction limit is set to zero.

This check is not performed if the BASE24-billpay transaction limit for both the customer and the financial institution are set to zero.

The BASE24-billpay transaction limit is set for the customer in the Billpay Tran Limit field on the Customer Information screen and for the financial institution in the PAYMENT HIGH LIMIT field on the Bank Table screen. Refer to the ***BASE24 Base Files Maintenance Manual*** for more information about the Bank Table screen.

9. If the customer's financial institution uses the Positive Customer with Balances/History authorization method, the payment transaction must not exceed the periodic or cyclic usage accumulation limits configured for the customer's *from* account in the Positive Balance File (PBF).
10. If the Vendor Specific Desc field displays data, then the Vendor Specific Data field cannot be blank. If the Vendor Specific Desc field is blank, then the Vendor Specific Data field must be blank.

Screen 1 Function Keys

The use of three function keys on New Payment screen 1 differs from that specified for the standard CSR function keys explained in section 1. The use of these function keys is explained below.

The first column of information below shows the BASE24 keys. The second column describes the functions that can be accomplished with these function keys.

Key	Description
F1	Clear Screen — Clears all values currently displayed on the screen and displays default values in fields that have a default value.
F5	Enter Payment — Enters the immediate, future, or recurring scheduled payment transaction specified on the screen.
Shift-F4	Select From Account — Displays the Account List screen from which you can select an account to be displayed in the Cust From Acct and ACCT NUMBER fields.

Screen 1

New Payment screen 1 allows you to enter an immediate, future, or recurring scheduled payment. New Payment screen 1 is shown below, followed by descriptions of its fields.

Cust From Acct — The customer's account number to be debited for this payment.

The value from the ACCT NUMBER field is displayed here after a payment transaction is successfully entered. This field always contains the same value as the ACCT NUMBER field. If you change the value of this field using the **Shift-F4** keys, the value of the ACCT NUMBER field is changed as well.

The type of customer account (for example, DDA) is displayed to the right of the Cust From Acct field value.

Field Length: System-protected
Column Names: HIST.FROM_ACCT_NUM
FUTR.FROM_ACCT_NUM (for future payments only)
RCUR.FROM_ACCT_NUM (for recurring payments only)

Transaction Amount — The amount of the payment in whole and fractional currency units (for example, U.S. dollars and cents). Fractional currency units must be entered to the right of a decimal point. A negative amount cannot be entered.

The amount entered must meet the system validation requirements discussed earlier in this section.

Field Length: 1–20 alphanumeric characters, with 19 numeric characters and 1 optional decimal point character
Required Field: Yes
Default Value: No default value
Column Names: HIST.AMT
FUTR.AMT
RCUR.AMT

Payment Type — A flag indicating whether this is an immediate, future, or recurring scheduled payment. Valid values are as follows:

F = Future payment
I = Immediate payment
R = Recurring payment

If this field is set to the value I, the current business date is used.

If this field is set to the values F or R, the date entered in the First Payment Date field must be greater than or equal to the current business date.

Field Length: 1 alphabetic character
Required Field: Yes
Default Value: If you accessed the New Payment screen by selecting a transaction type on the Transaction Menu, this field defaults to the payment type selected. Otherwise, no default value is displayed.
Column Names: HIST.SCHD_TYP
FUTR.SCHD_TYP (for future and recurring payments only)

First Payment Date — The date on which the first payment is to be made for this transaction. For an immediate payment, you must leave this field blank. If you attempt to enter a date for an immediate payment, an error message is displayed. The current business date is always assumed for immediate payments. For future and recurring scheduled payments, you cannot leave this field blank.

The format in which the date in this field is entered and displayed (for example, YYYYMMDD) is displayed immediately to the right of the First Payment Date field value.

If the Payment Type field is set to the value I, leave this field blank.

If the Payment Type field is set to the values F or R, the date entered in this field must be greater than or equal to the current business date.

All dates entered in this field must pass the system validation requirements discussed earlier in this section.

Field Length: 8 numeric characters
Required Field: No
Default Value: No default value
Column Names: HIST.PMT_DATE
FUTR.PMT_DATE (for future payments only)
RCUR.INIT_PMT_DATE (for recurring payments only)

Vend Specific Desc — A description of the vendor-specific data that must be entered in the Vend Specific Data field. If this field is blank, then no vendor-specific data can be entered in the Vend Specific Data field.

Field Length: System-protected
Column Name: VNDR.VEND_SPECIFIC_DATA_DESC

Type — A user-defined code indicating the type of vendor-specific data to be entered in the Vend Specific Data field.

Field Length: System-protected
Column Name: VNDR.VEND_SPECIFIC_DATA_TYP

Vend Specific Data — User-defined vendor-specific data that must be entered for this vendor. This field is required only if the Vend Specific Desc field contains a value.

Field Length: 1–30 alphanumeric characters
Required Field: No
Default Value: No default value
Column Names: HIST.VEND_SPECIFIC_DATA
FUTR.VEND_SPECIFIC_DATA (for future payments only)
RCUR.VEND_SPECIFIC_DATA (for recurring payments only)

Recurring Transaction Details

The following two fields define the total number of payments and the recurring payment period for recurring scheduled payments.

Total Number of Payments to Make — The total number of payments to be made.

Field Length: 1–4 numeric characters
Required Field: Yes, if this is a recurring payment
Default Value: 0
Column Name: RCUR.TOT_PMT

Recurring Period — A code identifying the payment frequency. Valid values are as follows:

WK = Weekly
2W = Every two weeks
MN = Monthly
Q = Quarterly (every three months)
S = Semi-annually (every six months)
A = Annually (once a year)

Field Length: 1–2 alphanumeric characters
Required Field: Yes, if this is a recurring payment.
Default Value: No default value
Column Name: RCUR.RECUR_PERIOD

Screen 1, Immediate Response Format

The immediate response version of New Payment screen 1 is displayed in response to all immediate scheduled payments or when a future or recurring scheduled payment is denied. New Payment screen 1 in the immediate response format is shown below, followed by descriptions of its fields. Only the fields that differ from New Payment screen 1 are described.

```

BASE24-CORE  NEW PAYMENT                LLLL      YY/MM/DD  hh:mm   01 OF  01

```

Ref Num — A unique system-generated number used to reference historical data for this payment transaction for this customer.

Field Length: System-protected

Column Name: HIST.REF_NUM

BP Entry — The date and time this payment transaction was entered into the system (that is, was received by the BASE24-billpay Billpay Server process).

The format (for example, YYYYMMDD) in which the date in this field is displayed is provided immediately below the BP Entry field value on the screen.

The time is always displayed in hh:mm:ss format.

Field Length: System-protected
Column Name: HIST.BP_GMT

Response

The following fields describe the outcome of an immediate scheduled payment transaction or a denied future or recurring scheduled payment transaction.

Action Code — A code indicating the processing outcome of this payment transaction. A description of the code configured in the Response Text Table (RTXT) is displayed immediately to the right of the field value. Refer to the *BASE24 Remote Banking Transaction Processing Manual* for a list of all possible action codes. Refer to the *BASE24-billpay Tables Maintenance Manual* for a description of the RTXT.

Field Length: System-protected
Column Name: HIST.RSP_CODE

Action Indicator — A code indicating the account to which an action code applies. This code is used for action code 114 (no account of type requested) to identify the account type. Valid values are as follows:

- 1 = Account 1 (single account or *from* account—the account specified in the Cust From Acct field)
- 2 = Account 2 (*to* account—the account specified in the Acct With Vendor field)
- B = Backup account

Field Length: System-protected
Column Name: Not applicable

Approval Code — The approval code assigned to the transaction by the transaction authorizer (that is, the entity that authorized the withdrawal of funds from the customer's account for this payment). An approval code is a random number generated for an approved transaction. For denied transactions, this field is blank.

Field Length: System-protected
Column Name: HIST.AUTH_APPRV_CODE

Date Posted — The date this payment transaction was posted to the system.

The format (for example, YYYYMMDD) in which the date in this field is displayed is provided immediately to the right of the Date Posted field value on the screen.

Field Length: System-protected

Column Name: Not applicable

Available for Withdrawal — The maximum amount, in whole and fractional currency units (for example, U.S. dollars and cents), currently available for withdrawal from the customer's *from* account for this payment. A value is displayed in this field when insufficient funds exist in the customer's *from* account or when the original payment amount requested would cause the BASE24-telebanking payment limits in the Positive Balance File (PBF) to be exceeded.

The amount available for withdrawal is displayed in the same currency as that of the payment transaction.

Field Length: System-protected

Column Name: Not applicable

Balance — The current balance amount, in whole and fractional currency units, of the account named in the Cust From Acct field or the Acct With Vendor field.

These fields may or may not contain values, depending on how balances are displayed for the customer's financial institution.

One of the following possible types of balances reflected in this field may be displayed to the right of the Balance field value, depending on how the customer's financial institution is configured to display account balances:

LEDGER 1	= The ledger balance of the Cust From Acct, if it is a debit account.
AVAILABLE 1	= The available balance of the Cust From Acct, if it is a debit account.
AMOUNT OWED	= The amount owed or credit balance for a loan or credit account.

AMOUNT DUE	= The amount due for a loan account. This type of balance amount is not currently supported.
AVAILABLE CREDIT	= The available credit for a credit account.
LEDGER 2	= The ledger balance of the Acct With Vendor account, if it is a debit account with the same financial institution as the Cust From Acct.
AVAILABLE 2	= The available balance of the Acct With Vendor account, if it is a debit account with the same financial institution as the Cust From Acct.
UNKNOWN	= The type of balance is unknown.

If the balance information returned is too large to fit in this field, it will display all asterisks.

The balance amount in this field is displayed in the currency specified in the Crncy field.

Field Length: 2 fields, system-protected
Column Name: Not applicable

Crncy — A code that identifies the currency of the balance amount displayed in the Balance field. Reserved values are listed in the 1990 ISO 4217 standard, *Codes for the Representation of Currencies and Funds*.

Field Length: 2 fields, system-protected
Column Name: Not applicable

Date — The date this balance was determined.

The format (for example, YYYYMMDD) in which the date in this field is displayed is provided immediately above the Date field value on the screen.

Field Length: 2 fields, both system-protected
Column Name: Not applicable

Section 27

New Transfer

The New Transfer screen is a BASE24-billpay screen that allows you to schedule future and recurring transfers.

Note: Only internal transfers or transfers between two accounts owned by the same financial institution can be performed on the New Transfer screen. A transfer immediate transaction is a telebanking function and must be entered on the Transaction Selection screen. External transfers or transfers between accounts belonging to two different financial institutions can only be performed as payments. In this case, the financial institution owning the *to* account must be configured as the vendor to receive the payment and the *to* account must be configured as the account with vendor. Thus, external transfers are performed using the New Payment screen.

You can access the New Transfer screen by selecting either the SCHEDULE TRANSFER – FUTURE or SCHEDULE TRANSFER – RECURRING transaction from the Transaction Menu. You can also access the New Transfer screen by pressing the **Shift-F2** keys on the Customer Information screen or Scheduled Transactions screen.

When the New Transfer screen is displayed, the Transfer Type field defaults to the type selected (future or recurring) when you access the screen. For each transfer scheduled, valid values must be displayed in each of the following fields:

- From Account
- To Account
- Transaction Amount
- Transfer Type
- First Transfer Date
- Total Number of Transfers to Make (required for recurring transfers only)
- Recurring Period (required for recurring transfers only)

If the customer does not know the *from* account for the transfer, you can select the *from* account from all accounts defined for the customer on the Account List screen by pressing the **Shift-F4** keys. You can then select an individual account on this screen to be returned and displayed in the From Account field on the New Transfer screen by pressing the **F1** key.

If the customer does not know the *to* account for the transfer, you can select the *to* account from all accounts defined for the customer on the Account List screen by pressing the **Shift-F5** keys. You can then select an individual account on this screen to be returned and displayed in the To Account field on the New Transfer screen by pressing the **F1** key.

After you have entered all the appropriate information for the type of transfer to be made, press the **F5** key to enter the transfer. The system validates the transfer request, approves or denies the transaction, and displays the appropriate response information on the screen.

For denied future and recurring scheduled transfers, the denied response version of the New Transfer screen is displayed. For approved future and recurring scheduled transfer transactions, the Scheduled Transfer Detail screen is displayed.

For approved future and recurring scheduled transfers, you can update some transaction data using the Change Tran fields displayed near the bottom of the Scheduled Transfer Detail screen. You can also delete the transaction or skip the next transfer period on this screen.

If a future or recurring scheduled transfer is denied, you can press the **F1** key to clear the screen before attempting to reenter the transfer or before entering additional transfers.

Refer to section 3 of this manual for detailed step-by-step instructions for entering a future and recurring scheduled transfer. The validation criteria required for each transfer transaction is discussed on the following pages.

Transfer Validation

The following validation processing is performed by the system for each submitted scheduled transfer transaction. The transaction must pass all these validation checks before it can be authorized.

1. The value in the First Transfer Date field on the New Transfer screen must be greater than or equal to the value in the Start Date field and less than or equal to the value in the End Date field for the customer on the Customer Information screen.
2. The value in the First Transfer Date field on the New Transfer screen must be greater than or equal to the value in the Begin field and less than or equal to the value in the End field for each account selected from the Account List screen.
3. The *from* account specified in the From Account field must allow debit transactions and have a status that allows transfers from the account.
4. The *to* account specified in the To Account field must allow credit transactions and have a status that allows transfers to the account.
5. If the customer's financial institution uses the Positive Customer with Balances/History Authorization method, the transfer transaction must not exceed the periodic or cyclic usage accumulation limits configured for the *from* account in the Positive Balance File (PBF).

Screen 1 Function Keys

The use of one function key on New Transfer screen 1 differs from that specified for the standard CSR function keys explained in section 1. The use of this function key is explained below.

The first column of information below shows the BASE24 key. The second column describes the function that can be accomplished with this function key.

Key	Description
F5	Enter Transfer — Enters the scheduled future or recurring transfer transaction specified on the screen.

ACCT NUMBER — An application account number for this customer. An account number is displayed in this field only if one was entered and retrieved during customer verification processing. Otherwise, this field is blank.

This field always contains the same value as the From Account field. If you change the value of the From Account field, the value of this field is changed as well.

Field Length: System-protected
Column Name: CACT.ACCT

NAME — The customer's family name or last name, followed by the customer's given name or first name, and the customer's middle initial. The name displayed in these fields was retrieved during customer verification processing.

Field Length: System-protected
Column Names: PIT.NAM_FMLY
 PIT.NAM_GIVEN
 PIT.NAM_M_I

From Account — The number of the customer account to be debited in this transfer. This is the account from which the transfer is to be made.

This field always contains the same value as the ACCT NUMBER field. If you change the value of this field, the value of the ACCT NUMBER field is changed as well.

The type of customer account (for example, DDA) from which the transfer is to be made is displayed to the right of the From Account field value.

Field Length: 1–22 alphanumeric characters
Required Field: Yes
Default Value: No default value
Column Names: HIST.FROM_ACCT_NUM
 FUTR.FROM_ACCT_NUM (for future transfers only)
 RCUR.FROM_ACCT_NUM (for recurring transfers only)

To Account — The number of the customer account to be credited in this transfer. This is the account to which the transfer is to be made.

The type of customer account (for example, DDA) to which the transfer is to be made is displayed to the right of the To Account field value.

Field Length: 1–22 alphanumeric characters
Required Field: No
Default Value: No default value
Column Names: HIST.TO_ACCT_NUM
FUTR.TO_ACCT_NUM (for future transfers only)
RCUR.TO_ACCT_NUM (for recurring transfers only)

Transaction Amount — The amount of the transfer in whole and fractional currency units (for example, U.S. dollars and cents). Fractional currency units must be entered to the right of a decimal point. A negative amount cannot be entered.

The amount entered must meet the system validation requirements discussed earlier in this section.

Field Length: 1–20 alphanumeric characters, with 19 numeric characters and 1 optional decimal point character
Required Field: Yes
Default Value: No default value
Column Names: HIST.AMT
FUTR.AMT (for future transfers only)
RCUR.AMT (for recurring transfers only)

Transfer Type — A flag indicating whether this is a future or recurring scheduled transfer. Valid values are as follows:

F = Future transfer
R = Recurring transfer

Field Length: 1 alphabetic character
Required Field: Yes
Default Value: If you accessed the New Transfer screen by selecting a transaction type on the Transaction Menu, this field defaults to the type of transfer selected. Otherwise, no default value is displayed.
Column Names: HIST.SCHD_TYP
FUTR.SCHD_TYP (for future payments only)

First Transfer Date — The date on which the first transfer is to be made for this transaction. The date entered in this field must be greater than or equal to the current business date.

The format in which the date in this field is entered and displayed (for example, YYYYMMDD) is displayed immediately to the right of the First Transfer Date field value.

All dates entered in this field must pass the system validation requirements discussed earlier in this section.

Field Length: 8 numeric characters
Required Field: Yes
Default Value: No default value
Column Names: HIST.PMT_DATE
FUTR.PMT_DATE (for future payments only)
RCUR.INIT_PMT_DATE (for recurring payments only)

Recurring Transaction Details

The following two fields define the total number of transfers to make and the recurring transfer period for recurring scheduled transfers only.

Total Number of Transfers to Make — The total number of transfers to be made.

Field Length: 1–4 numeric characters
Required Field: Yes, if this is a recurring scheduled transfer.
Default Value: 0
Column Name: RCUR.TOT_PMT

Recurring Period — A code identifying the frequency of transfers. Valid values are as follows:

2W = Every two weeks
A = Annually (once a year)
MN = Monthly
Q = Quarterly (every three months)
S = Semi-annually (every six months)
WK = Weekly

Field Length: 1–2 alphanumeric characters
Required Field: Yes, if this is a recurring scheduled transfer.
Default Value: No default value
Column Name: RCUR.RECUR_PERIOD

Screen 1 Denied Response

The denied response version of the New Transfer screen 1 is displayed when a future or recurring scheduled transfer is denied. New Transfer screen 1 (denied response) is shown below, followed by descriptions of its fields. Only the fields that differ from New Transfer screen 1 are described.

```

BASE24-CORE  NEW TRANSFER          LLLL      YY/MM/DD  hh:mm   01 OF  01

      BANK:                          CUSTOMER ID:

```

Ref Num — A unique system-generated number used to reference historical data for this transfer transaction for this customer.

Field Length: System-protected
Column Name: HIST.REF_NUM

BP Entry — The date and time this payment transaction was entered into the system (that is, was received by the BASE24-billpay Billpay Server process).

The format (for example, YYYYMMDD) in which the date in this field is displayed is provided immediately below the BP Entry field value on the screen.

The time is always displayed in hh:mm:ss format.

Field Length: System-protected
Column Name: HIST.BP_GMT

Response

The following fields describe the outcome of a denied future or recurring scheduled transfer transaction.

Action Code — A code indicating the processing outcome of this transfer transaction. A description of the code configured in the Response Text Table (RTXT) is displayed immediately to the right of the field value. Refer to the ***BASE24 Remote Banking Transaction Processing Manual*** for a list of all possible action codes. Refer to the ***BASE24-billpay Table Maintenance Manual*** for a description of the RTXT.

Field Length: System-protected
Column Name: HIST.RSP_CODE

Action Indicator — A code indicating the account to which an action code applies. This code is used for action code 114 (no account of type requested) to identify the account type. Valid values are as follows:

- 1 = Account 1 (single account or *from* account—the account specified in the From Account field)
- 2 = Account 2 (*to* account—the account specified in the To Account field)
- B = Backup account

Field Length: System-protected
Column Name: Not applicable

Approval Code — The approval code assigned to the transaction by the transaction authorizer (that is, the entity that authorized the withdrawal of funds from the customer's *from* account for this transfer). An approval code is a random number generated for an approved transaction. This field is blank for denied transactions.

Field Length: System-protected
Column Name: HIST.AUTH_APPRV_CODE

Date Posted — The date this transfer transaction was posted to the Billpay History Table (HIST).

The format (for example, YYYYMMDD) in which the date in this field is displayed is provided immediately to the right of the Date Posted field value on the screen.

Field Length: System-protected
Column Name: Not applicable

Available for Withdrawal — The maximum amount, in whole and fractional currency units (for example, U.S. dollars and cents), currently available for withdrawal from the customer's *from* account for this transfer. A value is displayed in this field when insufficient funds exist in the customer's *from* account or when the original transfer amount requested would cause the BASE24-telebanking transfer limits in the Positive Balance File (PBF) to be exceeded.

The amount available for withdrawal is displayed in the same currency as that of the transfer transaction.

Field Length: System-protected
Column Name: Not applicable

Balance — The current balance amount, in whole and fractional currency units, of the *from* account or the *to* account.

These fields may or may not contain values, depending on how balances are displayed for the customer's financial institution.

One of the following possible types of balances reflected in this field may be displayed to the right of the Balance field value, depending on how the customer's financial institution is configured to display account balances:

LEDGER 1	= The ledger balance of the <i>from</i> account, if it is a debit account.
AVAILABLE 1	= The available balance of the <i>from</i> account, if it is a debit account.
AMOUNT OWED	= The amount owed or credit balance for a loan or credit account.
AMOUNT DUE	= The amount due for a loan account. This type of balance amount is not currently supported.
AVAILABLE CREDIT	= The available credit for a credit account.
LEDGER 2	= The ledger balance of the <i>to</i> account, if it is a debit account.

AVAILABLE 2 = The available balance of the *to* account, if it is a debit account.

UNKNOWN = The type of balance is unknown.

If the balance information returned is too large to fit in this field, it will display all asterisks.

The balance amount in this field is displayed in the currency specified in the Crncy field.

Field Length: 2 fields, both system-protected

Column Name: Not applicable

Crncy — A code that identifies the currency of the balance amount displayed in the Balance field. Reserved values are listed in the 1990 ISO 4217 standard, *Codes for the Representation of Currencies and Funds*.

Field Length: 2 fields, system-protected

Column Name: Not applicable

Date — The date this balance was determined.

The format (for example, YYYYMMDD) in which the date in this field is displayed is provided immediately above the Date field value on the screen.

Field Length: 2 fields, system-protected

Column Name: Not applicable

Section 28

Scheduled Payment Detail

The Scheduled Payment Detail screen is a BASE24-billpay screen displayed when a new future or recurring scheduled payment transaction entered on the New Payment screen is approved. It is also displayed when you select to view the transaction detail for a currently scheduled payment on the Scheduled Transactions screen.

The Scheduled Payment Detail screen allows you to review and change detailed transaction information.

For currently scheduled future payments, you can change the transaction amount, next payment date, and any vendor-specific data on this screen.

For currently scheduled recurring payments, you can change some or all of the following values, depending on whether at least one payment has already been made for the transaction: transaction amount, next payment date, total number of recurring payment periods, period length, and any vendor-specific data.

Besides updating transaction data, you can also delete scheduled payment transactions or skip the next payment period for a transaction on the Scheduled Payment Detail screen.

Note: Updating transactions, deleting transactions, and skipping a payment period can be done only as long as the Scheduled Transaction Initiator process is not currently processing the transaction. The Processing Status field indicates whether the Scheduled Transaction Initiator process is currently processing the transaction.

This section describes the conditions required to change scheduled payment transaction data, the system validation requirements for entering this data, followed by detailed screen and field descriptions. The Scheduled Payment Detail screen consists of two screens, each of which is described below:

- Screen 1 displays the information specified when the transaction was entered. It also allows you to update certain fields for the transaction.
- Screen 2 displays details concerning the processing of the transaction.

Updating Scheduled Payment Transaction Data

After a future or recurring scheduled payment has been entered and approved, you can still change some of the transaction details on the Scheduled Payment Detail screen.

For a future scheduled payment, the amount of the payment (Amt field), the date on which the payment will occur (Next date field), and any vendor-specific data associated with the vendor (Vend Specific Data field) can be changed.

For a recurring scheduled payment, any data can be changed. If the total number of recurring payments is changed, it must be changed to a value that is greater than the number of payments already made.

Validation Requirements

The following validation processing is performed by the system any time you attempt to update transaction details. The updated data must pass all these validation checks before it can be used.

1. The value in the Next Date field on the Scheduled Payment Detail screen must be greater than or equal to the values in the start date fields and less than or equal to the values in the end date fields on the following screens:
 - Customer Information
 - Vendor Registry
 - Customer Vendor Detail
2. The transaction amount entered in the Amt field must be less than or equal to the following:
 - A nonzero value for the customer's BASE24-billpay transaction limit, regardless of the financial institution's BASE24-billpay transaction limit.
 - A nonzero value for the financial institution's BASE24-billpay transaction limit, if the customer's BASE24-billpay transaction limit is set to zero.

This check is not performed if the BASE24-billpay transaction limit for both the customer and the financial institution are set to zero.

The BASE24-billpay transaction limit is set for the customer in the Billpay Tran Limit field on the Customer Information screen and for the financial institution in the PAYMENT HIGH LIMIT field on the Bank Table screen. Refer to the ***BASE24 Base Files Maintenance Manual*** for more information about the Bank Table screen.

Screen 1 Function Keys

The use of two function keys on Scheduled Payment Detail screen 1 differs from that specified for the standard CSR function keys explained in section 1. The use of these function keys is explained below.

The first column of information below shows the BASE24 keys. The second column describes the functions that can be accomplished with these function keys.

Key	Description
F6	Delete — Deletes the scheduled payment currently displayed on the screen.
F8	Update — Updates the scheduled payment currently displayed on the screen.

Screen 1

Scheduled Payment Detail screen 1 allows you to view and change the parameters for a currently scheduled future or recurring payment. Scheduled Payment Detail screen 1 is shown below, followed by descriptions of its fields.

BANK — The name of the customer’s financial institution. The value in this field was retrieved during customer verification processing.

Field Length: System-protected
Column Name: BANK.BANK_NAME

CUSTOMER ID — The unique identification number assigned to the customer. The value in this field was retrieved during customer verification processing.

Field Length: System-protected
Column Name: CSTT.PAN

ACCT NUMBER — An application account number for this customer. An account number is displayed in this field only if one was entered and retrieved during customer verification processing. Otherwise, this field is blank.

Field Length: System-protected
Column Name: CACT.ACCT

NAME — The customer's family name or last name, followed by the customer's given name or first name, and the customer's middle initial. The name displayed in these fields was retrieved during customer verification processing.

Field Length: System-protected
Column Names: PIT.NAM_FMLY
PIT.NAM_GIVEN
PIT.NAM_M_I

CustVend Number — The number of the customer vendor to receive this payment.

Field Length: System-protected
Column Name: CVND.CUST_VEND_NUM

Ref Num — A unique system-generated number used to reference historical data for this transaction.

Field Length: System-protected
Column Name: HIST.REF_NUM

Vendor Name — The name of the vendor to receive this scheduled payment.

Field Length: System-protected
Column Name: VNDR.VEND_NAME

BP Entry — The date and time this scheduled payment transaction was entered into the system (that is, was received by the BASE24-billpay Billpay Server process).

The format (for example, YYYYMMDD) in which the date in this field is displayed is provided immediately below the BP Entry field value on the screen.

The time is always displayed in hh:mm format.

Field Length: System-protected
Column Name: FUTR.BP_GMT

Acct With Vendor — The customer's account number with the vendor to which this payment is posted or credited.

Field Length: 1–28 alphanumeric characters
Required Field: Yes
Default Value: No default value
Column Name: FUTR.ACCT_WITH_VEND

Cust From Acct — The customer's account number to be debited for this payment.

The type of customer account (for example, DDA) is displayed to the right of the Cust From Acct field value.

Field Length: System-protected
Column Name: FUTR.FROM_ACCT_NUM

Transaction Amount — The amount of the payment in whole and fractional currency units (for example, U.S. dollars and cents). Fractional currency units must be entered to the right of a decimal point. A negative amount cannot be entered.

The amount entered must meet the system validation requirements discussed earlier in this section.

Field Length: 1–20 alphanumeric characters, with 19 numeric characters and 1 optional decimal point character
Required Field: Yes
Default Value: No default value
Column Name: FUTR.AMT

Payment Type — A flag indicating the type of scheduled payment. Valid values are as follows:

F = Future payment
R = Recurring payment

Field Length: 1 alphabetic character
Required Field: Yes
Default Value: No default value
Column Name: FUTR.SCHD_TYPE

Payment Date

The dates on which the next payment and initial payment are to be made for this future or recurring scheduled payment.

Next — The date on which the next payment is to be made. For future scheduled payments, this field is blank or contains the same date as the Initial field.

The format in which the date in this field is entered and displayed (for example, YYYYMMDD) is displayed immediately to the right of the Initial field value on the screen.

If you use the **Shift-F6** keys to skip the next payment for a recurring scheduled payment, the value of this field is modified accordingly.

Field Length: System-protected
Column Name: FUTR.PMT_DATE

Initial — The date on which the initial payment is to be made.

The format in which the date in this field is entered and displayed (for example, YYYYMMDD) is displayed immediately to the right of the Initial field value on the screen.

Field Length: System-protected
Column Names: FUTR.PMT_DATE
RCUR.INIT_PMT_DATE

Vend Specific Desc — A description of the vendor-specific data that is entered in the Vend Specific Data field for this vendor. If this field is blank, then no vendor-specific data is required.

Field Length: System-protected
Column Name: VNDR.VEND_SPECIFIC_DATA_DESC

Type — A user-defined code indicating the type of vendor-specific data displayed in the Vend Specific Data field.

Field Length: System-protected
Column Name: VNDR.VEND_SPECIFIC_DATA_TYP

Vend Specific Data — User-defined vendor-specific data entered for this vendor. This field can display data only if the Vend Specific Desc field contains a description.

Field Length: System-protected
Column Name: FUTR.VEND_SPECIFIC_DATA

Recurring Transaction Details

The following four fields display information specific to recurring scheduled payment transactions.

Total Number of Payments to Make — The total number of payments to make.

Field Length: System-protected
Column Name: RCUR.TOT_PMT

Number of Payments Made — The total number of payments already made. If the initial payment was to be made immediately, this field is set to the value 1.

Field Length: System-protected
Column Name: RCUR.PMT_MADE

Recurring Period — A code indicating the payment frequency. Valid values are as follows:

2W = Every two weeks
A = Annually (once a year)
MN = Monthly
Q = Quarterly (every three months)
S = Semi-annually (every six months)
WK = Weekly

Field Length: System-protected
Column Name: RCUR.RECUR_PERIOD

Number of Payments Remaining — The total number of payments remaining to be made. This is the difference between the total number of payments and the number of payments made.

Field Length: System-protected
Column Name: Not applicable

Change Tran? Enter Data and Use Update

The following five fields allow you to change the amount, next payment date, total number of payments, recurring payment period, and vendor specific data for the future or recurring scheduled payment transaction. Refer to the discussion on updating scheduled payment transaction data provided earlier in this section to determine the conditions for which a field can be updated. After changing data in any of these fields, press the **F8** key to update the data.

Amt — The amount of the payment in whole and fractional currency units (for example, U.S. dollars and cents). Fractional currency units must be entered to the right of a decimal point. A negative amount cannot be entered.

The amount entered must meet the system validation requirements discussed earlier in this section.

Field Length: 1–20 alphanumeric characters, with 19 numeric characters and 1 optional decimal point character
Required Field: No
Default Value: No default value
Column Names: FUTR.AMT
RCUR.AMT

Next Date — The date on which the next payment is to be made.

For future scheduled payments, this field changes the date on which the payment will be made.

For recurring scheduled payments, this field changes the date on which the next payment will be made, and the date on which all subsequent payment periods will be based. For example, if a customer currently makes a recurring payment on the fifth of each month, but wants the payments to be made on the third of each month instead, changing the next payment date in this field to the third of the next month will cause all subsequent payments to also be made on the third of each month.

The format in which the date in this field is entered and displayed (for example, YYYYMMDD) is displayed immediately to the right of the Payment Date: Initial field value on the screen.

Field Length: 8 numeric characters
Required Field: No
Default Value: No default value
Column Names: FUTR.PMT_DATE
RCUR.INIT_PMT_DATE

Recur

The following two fields allow you to change the total number of payments to make and the recurring payment period for a recurring scheduled payment transaction. Valid values can be entered in these fields only if the Payment Type field is set to the value R.

Total — The total number of payments to make. The value entered in this field must be greater than the value in the Number of Payments Made field.

Field Length: 1–4 numeric characters
Column Name: RCUR.TOT_PMT

Period — A code identifying the frequency of recurring payments. Valid values are as follows:

2W = Every two weeks
A = Annually (once a year)
MN = Monthly
Q = Quarterly (every three months)
S = Semi-annually (every six months)
WK = Weekly

Field Length: 1–2 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: RCUR.RECUR_PERIOD

Vend Specific — User-defined vendor-specific data that must be entered for this vendor. A value can be entered in this field only if the Vend Specific Desc field contains a description.

Field Length: 1–30 alphanumeric characters
Required Field: No
Default Value: No default value
Column Names: FUTR.VEND_SPECIFIC_DATA
RCUR.VEND_SPECIFIC_DATA

Acct — The new value of the From Account Number field. A value must also be entered in the type field when the Acct field contains a value.

Field Length: 1–19 alphanumeric characters
Required Field: No
Default Value: No default value
Column Names: FUTR.FROM_ACCT_NUM
RCUR.FROM_ACCT_NUM

<type> — The new value of the From Account Type field. A value can be entered in this field only if the Acct field contains information.

Field Length: 1–6 alphanumeric characters
Required Field: Yes, if the Acct field contains a value.
Default Value: No default value
Column Names: FUTR.FROM_ACCT_TYP
RCUR.FROM_ACCT_TYP

Screen 2 Function Keys

The use of two function keys on Scheduled Payment Detail screen 2 differs from that specified for the standard CSR function keys explained in section 1. The use of these function keys is explained below.

The first column of information below shows the BASE24 keys. The second column describes the functions that can be accomplished with these function keys.

Key	Description
F6	Delete — Deletes the scheduled payment currently displayed on the screen.
F8	Update — Updates the scheduled payment currently displayed on the screen.

Screen 2

Scheduled Payment Detail screen 2 displays current processing details for the scheduled payment transaction, including the processing status and the current status of retry processing. Scheduled Payment Detail screen 2 is shown below, followed by descriptions of its fields. The first eight fields from screen 1 are repeated on screen 2 for reference purposes. Only the fields that differ from screen 1 are described.

```

BASE24-CORE  SCHEDULED PAYMENT DETAIL LLLL  FIID  YY/MM/DD  hh:mm  2 OF  2

      BANK:                                CUSTOMER ID:

```

Billing Text — The billing text, if any, associated with this transaction. This is the text normally displayed on the customer's account statement for the transaction.

Field Length: System-protected
Column Name: FUTR.BILL_TXT

STI Pmt — The date on which the Scheduled Transaction Initiator process will next attempt to make a payment for this scheduled transaction. This date may be different from the date displayed in the Payment Date: Next field on screen 1 if the process was unable to complete the transaction successfully on the specified next payment date.

The format (for example, YYYYMMDD) in which the date in this field is displayed is provided immediately above the STI Pmt field value on the screen.

Field Length: System-protected
Column Name: FUTR.STI_PMT_DATE

STI Req — The date and time when the Scheduled Transaction Initiator process requested a funds authorization for this payment transaction. The value in this field is transient and is displayed only during the Scheduled Transaction Initiator process authorization cycle.

The format (for example, YYYYMMDD) in which the date in this field is displayed is provided immediately above the STI Pmt field value on the screen.

The time is always displayed in hh:mm:ss format.

Field Length: System-protected
Column Name: FUTR.STI_REQ_GMT

Processing Status — A code indicating the current processing status of this scheduled payment transaction. Valid values are as follows:

⌀ = Not started
PA = Pending authorization
RP = Retry processing is pending
RW = Waiting to retry
All others = Unknown

A text description of the processing status is displayed immediately to the right of the code value.

Note: You can only update transaction data, delete transactions, or skip a payment period as long as the Scheduled Transaction Initiator process is not currently processing the transaction. If the status indicates the transaction is pending authorization or that retry processing is pending, the Scheduled Transaction Initiator process is currently processing the transaction and it cannot be altered. If the status indicates that processing has not started, is waiting to be retried, or is unknown, then the transaction can be altered.

Field Length: System-protected
Column Name: FUTR.PROCESSING_STAT

Tran Source

The following three fields describe the originating source for this transaction.

Type — A code indicating the originating source of this transaction. Valid values are as follows:

AD = Audio device (for example, an interactive voice response system)
IB = Inbound (customer service representative terminal)
PC = Personal computer
SP = Screen phone

Field Length: System-protected
Column Name: FUTR.TXN_SRC

Number — The transaction source number associated with this transaction.

Field Length: System-protected
Column Name: FUTR.TXN_SRC_NUM

Date — The date and time when the transaction source initiated this transaction.

The format (for example, YYYYMMDD) in which the date in this field is displayed is provided immediately above the STI Pmt field value on the screen.

The time is always displayed in hh:mm:ss format.

Field Length: System-protected
Column Name: FUTR.TXN_SRC_GMT

Retry

The following four fields describe any retry processing for the transaction.

Transient Count — The number of times the transaction has been retried due to a transient error condition. A transient error condition specifies a condition that typically exists for only a brief period of time and that can often be rectified without any operator intervention.

Field Length: System-protected
Column Name: FUTR.RETRY_CNT_TRANSIENT

NonTransient Count — The number of times the transaction has been retried due to a nontransient error condition. A nontransient error condition specifies a condition that may exist for an extended period of time (for example, insufficient funds) or may require operator intervention to rectify the condition.

Field Length: System-protected
Column Name: FUTR.RETRY_CNT_NONTRANSIENT

Next Processing Time — If the transaction is currently in a retry cycle, this is the date and time the system will next attempt to process the transaction.

The format (for example, YYYYMMDD) in which the date in this field is displayed is provided immediately below the Next Processing Time field value on the screen.

The time is always displayed in hh:mm:ss format.

Field Length: System-protected
Column Name: FUTR.RETRY_NEXT_PROCESSING_GMT

Last Action Code — A code indicating the processing outcome of the last retry attempt to process this payment transaction. A description of the code is displayed immediately to the right of the field value. Refer to the ***BASE24 Remote Banking Transaction Processing Manual*** for descriptions of all possible action codes.

Field Length: System-protected
Column Name: FUTR.RETRY_LAST_RSP_CODE

ACI Worldwide Inc.

Section 29

Scheduled Transactions

The Scheduled Transactions screen is a BASE24-billpay screen that allows you to peruse all currently scheduled transactions for a particular customer, view detailed scheduled transaction information, delete scheduled transactions, and skip a recurring scheduled payment or transfer period.

You can access the Scheduled Transactions screen by selecting any of the following transactions on the Transaction Menu or by pressing the **Shift-F4** keys on the Customer Information screen.

- SCHEDULED PAYMENT UPDATE
- SCHEDULED TRANSFER UPDATE
- SCHEDULED PAYMENT DELETE
- SCHEDULED TRANSFER DELETE
- SCHEDULED PAYMENTS LIST INQUIRY
- SCHEDULED TRANSFERS LIST INQUIRY
- SCHEDULED TRANSACTIONS LIST INQUIRY

The data displayed for each transaction varies depending on whether the transaction is a scheduled payment or transfer. For scheduled payments, the customer *from* account, account with vendor, vendor name, and customer vendor number are displayed. For scheduled transfers, the *from* account, *to* account, and the transaction reference number are displayed. The transaction amount, next action date, and recurring periods remaining are displayed for both scheduled payments and transfers.

The Scheduled Transactions screen allows you to scroll forward or backward through a customer's currently scheduled transactions, using a full or partial transaction reference number or the next action start date as a starting point. Transactions are then ordered by transaction reference number or next action date as selected.

When you find a transaction on which you want to perform an action, position the cursor in the transaction selection field displayed on the same row of the screen as the transaction and press one of the following function keys:

- To view scheduled transaction detail, press the **F1** key. The Scheduled Payment Detail or Scheduled Transfer Detail screen is displayed, depending on whether the scheduled transaction is a payment or a transfer, respectively. You can update certain transaction data, delete the transaction, or skip a recurring payment or transfer period.
- To delete the scheduled transaction, press the **F6** key. The screen will prompt you to confirm your request.
- To skip the next payment or transfer for the scheduled transaction, press the **Shift-F6** keys. This function applies to recurring transactions only.

Note: Updating transactions, deleting transactions, and skipping a payment or transfer period can only be done as long as the Scheduled Transaction Initiator process is not currently processing the transaction. If the processing status on the appropriate transaction detail screen indicates the transaction is pending authorization or retry processing, the Scheduled Transaction Initiator process is currently processing the transaction and it cannot be altered. If the status indicates that processing has not started, is waiting to be retried, or is unknown, then the transaction can be altered.

Screen 1 Function Keys

The use of three function keys on Scheduled Transactions screen 1 differs from that specified for the standard CSR function keys explained in section 1. The use of these function keys is explained below.

The first column of information below shows the BASE24 keys. The second column describes the functions that can be accomplished with these function keys.

Key	Description
F1	Transaction Detail — Selects the transaction displayed on the same line of the screen as the cursor and displays transaction detail on either the Scheduled Payment Detail or Scheduled Transfer Detail screen.
Shift-F7	Previous — Retrieves the previous three currently scheduled transactions for this customer ID. A value in the Query Reference Number field when these keys are pressed determines the order in which transactions are arranged, as follows: • If the Query Reference Number field contains a value, this value is used as a starting point to select the previous three transactions displayed. • If the Query Reference Number field is blank, the value in the Rfrnce Number field or the NextAction field for the first transaction currently displayed is used to select the previous three transactions displayed, depending on the key path last used. The Query Reference Number or Query Next Action Start Date fields at the top of the screen define the selected key path for this screen. You must use either the Query Reference Number field at least once with the Shift-F7 keys or either of these fields at least once with the Shift-F8 keys, before the value of the Rfrnce Number or NextAction field is used as the selected key path with the Shift-F7 keys. Once a key path is selected, both the Query fields can be blank when you press the Shift-F7 keys. The Query Next Action Start Date field must always be blank when you press the Shift-F7 keys.

Key	Description
Shift-F8	Next — Retrieves the next three currently scheduled transactions for this customer ID. Values in the Query Reference Number and Query Next Action Start Date fields when these keys are pressed determine the order in which transactions are arranged, as follows: • If the Query Reference Number field contains a value and the Query Next Action Start Date field is blank, this value is used as a starting point to select the next three transactions displayed. • If the Query Next Action Start Date field contains a value and the Query Reference Number field is blank, this value is used as a starting point to select the next three transactions displayed. • If both the Query Reference Number and Query Next Action Start Date fields are blank, the value in the Rfrnce Number field or the NextAction field for the last transaction currently displayed is used to select the next three transactions displayed, depending on the key path last used. The Query Reference Number or Query Next Action Start Date fields at the top of the screen define the selected key path for this screen. You must use either the Query Reference Number field at least once with the Shift-F7 keys or either of these fields at least once with the Shift-F8 keys, before the value of the Rfrnce Number or NextAction field is used as the selected key path with the Shift-F8 keys. Once a key path is selected, the Query fields can be blank when you press the Shift-F8 keys.

Screen 1

Scheduled Transactions screen 1 allows you to peruse scheduled transactions for a customer. From this screen, you can select to view detailed transaction information, delete a transaction, or skip a recurring payment or transfer period for a transaction. Place the cursor to the left of the transaction to be selected. Press the **F1**, **F6**, or **Shift-F6** function key to complete the action specified. Scheduled Transactions screen 1 is shown below, followed by descriptions of its fields.

BANK — The name of the customer’s financial institution. The value in this field was retrieved during customer verification processing.

Field Length: System-protected
Column Name: BANK.BANK_NAME

CUSTOMER ID — The unique identification number assigned to the customer. The value in this field was retrieved during customer verification processing.

Field Length: System-protected
Column Name: CSTT.PAN

ACCT NUMBER — An application account number for this customer. An account number is displayed in this field only if one was entered and retrieved during customer verification processing. Otherwise, this field is blank.

Field Length: System-protected
Column Name: CACT.ACCT

NAME — The customer's family name or last name, followed by the customer's given name or first name, and the customer's middle initial. The name displayed in these fields was retrieved during customer verification processing.

Field Length: System-protected
Column Names: PIT.NAM_FMLY
 PIT.NAM_GIVEN
 PIT.NAM_M_I

QUERY

The following two fields allow you to peruse scheduled transactions for this customer by entering a transaction reference number in the Reference Number field or the next action date in the Next Action Start Date field and pressing the **Shift-F7** or **Shift-F8** keys. The **Shift-F7** and **Shift-F8** keys allow you to view the previous three transactions or the next three transactions, respectively, based on the data entered. Refer to the "Screen 1 Function Keys" discussion for more information on how these keys are used.

Reference Number — A unique system-generated number used to reference historical data for this scheduled transaction.

Field Length: 6 numeric characters
Required Field: No
Default Value: No default value
Column Name: FUTR.REF_NUM

Next Action Start Date — The date on which the next payment or transfer is to be made for this scheduled transaction.

The format (for example, YYYYMMDD) in which the date in this field is displayed is provided immediately to the right of the Next Action Start Date value on the screen.

Field Length: 8 numeric characters
Required Field: No
Default Value: No default value
Column Name: FUTR.PMT_DATE

Tran Type — A code indicating the type of transaction. Valid values are as follows:

BLPY = Scheduled payment transaction
TRFR = Scheduled transfer transaction

A code indicating the specific type of scheduled transaction is displayed immediately below the Tran Type field value in parentheses. Valid values are as follows:

9B = Future scheduled payment transaction
9C = Recurring scheduled payment
9D = Future scheduled transfer
9E = Recurring scheduled transfer

Field Length: System-protected
Occurs: Up to 3 times
Column Name: FUTR.TXN_TYP

From Account — The number of the customer account to be debited in this scheduled payment or transfer transaction. This is the account from which the payment or transfer is to be made.

Field Length: System-protected
Occurs: Up to 3 times
Column Name: FUTR.FROM_ACCT_NUM

To:Acct or AcctwVend — The number of the customer account to be credited in this scheduled payment or transfer. For scheduled transfers, this is the customer account to which funds are to be transferred. For scheduled payments, this is the customer's account with the vendor to receive the payment.

Field Length: System-protected
Occurs: Up to 3 times
Column Names: FUTR.TO_ACCT_NUM (scheduled transfers)
FUTR.ACCT_WITH_VEND (scheduled payments)

Vendor Name — The name of the vendor to receive this future or recurring scheduled payment.

Field Length: System-protected
Occurs: Up to 3 times
Column Name: VNDR.VEND_NAME

Rfrnce — A unique system-generated number used to reference historical data for this scheduled transaction.

Field Length: System-protected
Occurs: Up to 3 times
Column Name: FUTR.REF_NUM

CstVnd Number — The number of the customer vendor to receive payments for this scheduled payment transaction.

Field Length: System-protected
Occurs: Up to 3 times
Column Name: CVND.CUST_VEND_NUM

Amount — The amount of the payment or transfer in whole and fractional currency units (for example, U.S. dollars and cents).

Field Length: System-protected
Occurs: Up to 3 times
Column Name: FUTR.AMT

NextAction — The date on which the next payment or transfer is to be made for this scheduled transaction. For future payments and transfers, this is the date on which the payment or transfer will be made.

The format in which the date in this field is displayed (for example, YYYYMMDD) is displayed immediately below the Entry Date heading on the screen.

If you use the **Shift-F6** keys to skip the next payment or transfer for a recurring scheduled transaction, the value displayed in this field is modified accordingly.

Field Length: System-protected
Occurs: Up to 3 times
Column Name: FUTR.PMT_DATE

EntryDate — The date this scheduled transaction was entered into the system (that is, processed by the BASE24-billpay Billpay Server process).

The format (for example, YYYYMMDD) in which the date in this field is displayed is provided immediately below the EntryDate heading on the screen.

Field Length: System-protected
Occurs: Up to 3 times
Column Name: FUTR.BP_GMT

Recur

The following two fields indicate the period on which recurring scheduled transactions are based and the number of remaining payments or transfers for the recurring transaction. No values are displayed in these fields for future scheduled transactions.

Period — A code identifying the transaction frequency. Valid values are as follows:

2W = Every two weeks
A = Annually (once a year)
MN = Monthly
Q = Quarterly (every three months)
S = Semi-annually (every six months)
WK = Weekly

Field Length: System-protected
Occurs: Up to 3 times
Column Name: RCUR.RECUR_PERIOD

Remaing — The total number of payments or transfers remaining to be made. This is the difference between the total number of payments or transfers and the number of payments or transfers already made.

Field Length: System-protected

Occurs: Up to 3 times

Column Name: Not applicable

Section 30

Scheduled Transfer Detail

The Scheduled Transfer Detail screen is a BASE24-billpay screen displayed in response when a new future or recurring scheduled transfer transaction entered on the New Transfer screen is approved. It is also displayed when you select to view the transaction detail for a currently scheduled transfer on the Scheduled Transactions screen.

The Scheduled Transfer Detail screen allows you review detailed transaction information.

For currently scheduled future transfers, you can change the transaction amount and the next payment date on this screen.

For currently scheduled recurring transfers, you can change some or all of the following, depending on whether at least one transfer has already been made for the transaction: transaction amount, next transfer date, total number of recurring transfer periods, and the period length.

Besides updating transaction data, you can also delete scheduled transfer transactions or skip the next transfer period for a scheduled transfer transaction on the Scheduled Transfer Detail screen.

Note: Updating transactions, deleting transactions, and skipping a transfer period can be done only as long as the Scheduled Transaction Initiator process is not currently processing the transaction. The Processing Status field indicates whether the Scheduled Transaction Initiator process is currently processing the transaction.

This section describes the conditions required to change scheduled transfer transaction data and the system validation requirements for entering this data, followed by detailed screen and field descriptions. The Scheduled Transfer Detail screen consists of two screens, each of which is described briefly below:

- Screen 1 displays the information specified when the transaction was entered. It also allows you to update certain fields for the transaction.
- Screen 2 displays details concerning the processing of the transaction.

Updating Scheduled Transfer Transaction Data

After a future or recurring scheduled transfer has been entered and approved, you can still change some of the transaction details on the Scheduled Transfer Detail screen. For a future scheduled transfer, the amount of the payment (Amt field) and the date on which the transfer will occur (Next Date field) can be changed.

For a recurring scheduled transfer, any data can be changed. If the total number of recurring transfers is changed, it must be changed to a value that is greater than the number of transfers already made.

Validation Requirements

The following validation processing is performed by the system any time you attempt to update transaction details. The updated data must pass all these validation checks before it can be used.

1. The value in the Next Date field on the Scheduled Transfer Detail screen must be greater than or equal to the value in the Start Date field and less than or equal to the value in the End Date field for the customer on the Customer Information screen.
2. The value in the Next Date field on the Scheduled Transfer Detail screen must be greater than or equal to the begin date value and less than or equal to the end date value for the customer's *from* account.
3. The value in the Next Date field on the Scheduled Transfer Detail screen must be greater than or equal to the begin date value and less than or equal to the end date value for the customer's *to* account.

Screen 1 Function Keys

The use of two function keys Scheduled Transfer Detail screen 1 differs from that specified for the standard CSR function keys explained in section 1. The use of these function keys is explained below.

The first column of information below shows the BASE24 keys. The second column describes the functions that can be accomplished with these function keys.

Key	Description
F6	Delete — Deletes the scheduled transfer currently displayed on the screen.
F8	Update — Updates the scheduled transfer currently displayed on the screen.

Screen 1

Scheduled Transfer Detail screen 1 allows you to view and change the parameters for a currently scheduled future or recurring transfer. Scheduled Transfer Detail screen 1 is shown below, followed by descriptions of its fields.

BANK — The name of the customer’s financial institution. The value in this field was retrieved during customer verification processing.

Field Length: System-protected
Column Name: BANK.BANK_NAME

CUSTOMER ID — The unique identification number assigned to the customer. The value in this field was retrieved during customer verification processing.

Field Length: System-protected
Column Name: CSTT.PAN

ACCT NUMBER — An application account number for this customer. An account number is displayed in this field only if one was entered and retrieved during customer verification processing. Otherwise, this field is blank.

Field Length: System-protected
Column Name: CACT.ACCT

NAME — The customer's family name or last name, followed by the customer's given name or first name, and the customer's middle initial. The name displayed in these fields was retrieved during customer verification processing.

Field Length: System-protected
Column Names: PIT.NAM_FMLY
PIT.NAM_GIVEN
PIT.NAM_M_I

From Account — The number of the customer account to be debited in this transfer. This is the account from which the transfer is to be made.

The type of customer account (for example, DDA) from which the transfer is to be made is displayed to the right of the From Account field value.

Field Length: System-protected
Column Name: FUTR.FROM_ACCT_NUM

Ref Num — A unique system-generated number used to reference historical data for this transaction.

Field Length: System-protected
Column Name: FUTR.REF_NUM

To Account — The number of the customer account to be credited in this transfer. This is the account to which the transfer is to be made.

The type of customer account (for example, DDA) to which the transfer is to be made is displayed to the right of the To Account field value.

Field Length: System-protected
Column Name: FUTR.TO_ACCT_NUM

BP Entry — The date and time this transfer transaction was entered into the system (that is, was received by the BASE24-billpay Billpay Server process).

The format (for example, YYYYMMDD) in which the date in this field is displayed is provided immediately below the BP Entry field value on the screen.

The time is always displayed in hh:mm format.

Field Length: System-protected

Column Name: FUTR.BP_GMT

Transaction Amount — The amount of the transfer in whole and fractional currency units (for example, U.S. dollars and cents).

Field Length: System-protected

Column Name: FUTR.AMT

Transfer Type — A flag indicating the type of scheduled transfer. Valid values are as follows:

F = Future scheduled transfer

R = Recurring scheduled transfer

Field Length: System-protected

Column Name: FUTR.SCHD_TYPE

Transfer Date

The dates on which the next transfer and initial transfer are to be made for this future or recurring scheduled transfer.

Next — The date on which the next transfer is to be made. For future transfers, this field is blank or contains the same date as the Initial field.

The format in which the date in this field is entered and displayed (for example, YYYYMMDD) is displayed immediately to the right of the Initial field value.

If you use the **Shift-F6** keys to skip the next transfer for a recurring scheduled transfer, the value of this field is modified accordingly.

Field Length: System-protected
Column Name: FUTR.PMT_DATE

Initial — The date on which the initial transfer is to be made.

The format in which the date in this field is entered and displayed (for example, YYYYMMDD) is displayed immediately to the right of the Initial field value.

Field Length: System-protected
Column Names: FUTR.PMT_DATE
RCUR.INIT_PMT_DATE

Recurring Transaction Details

The following four fields display information specific to recurring scheduled transfer transactions.

Total Number of Transfers to Make — The total number of transfers to make.

Field Length: System-protected
Column Name: RCUR.TOT_PMT

Number of Transfers Made — The total number of transfers already made. If the initial transfer was to be made immediately, this field is set to the value 1.

Field Length: System-protected
Column Name: RCUR.PMT_MADE

Recurring Period — A code indicating the transfer frequency. Valid values are as follows:

2W = Every two weeks
A = Annually (once a year)
MN = Monthly
Q = Quarterly (every three months)
S = Semi-annually (every six months)
WK = Weekly

Field Length: System-protected
Column Name: RECUR.RECUR_PERIOD

Number of Transfers Remaining — The total number of transfers remaining to be made. This is the difference between the total number of transfers and the number of transfers made.

Field Length: System-protected

Column Name: Not applicable

Change Tran? Enter Data and Use Update

The following four fields allow you to change the amount, next transfer date, total number of transfers, and recurring transfer period for the future or recurring scheduled transfer transaction. Refer to the discussion on updating scheduled transfer transaction data provided earlier in this section to determine the conditions for which a field can be updated. After changing data in any of these fields, press the **F8** key to update the data.

Amt — The amount of the transfer in whole and fractional currency units (for example, U.S. dollars and cents). Fractional currency units must be entered to the right of a decimal point. A negative amount cannot be entered.

Field Length: 1–20 alphanumeric characters, with 19 numeric characters and 1 optional decimal point character

Required Field: No

Default Value: No default value

Column Names: FUTR.AMT
RCUR.AMT

Next Date — The date on which the next transfer is to be made.

For future scheduled transfers, this field changes the date on which the transfer will be made.

For recurring scheduled transfers, this field changes the date on which the next transfer will be made, and the date on which all subsequent transfer periods will be based. For example, if a customer currently makes a recurring transfer on the fifth of each month, but wants the transfers to be made on the third of each month instead, changing the next transfer date in this field to the third of the next month will cause all subsequent transfers to also be made on the third of each month.

The format in which the date in this field is entered and displayed (for example, YYYYMMDD) is displayed immediately to the right of the Transfer Date: Initial field value.

Field Length: 8 numeric characters
Required Field: No
Default Value: No default value
Column Names: FUTR.PMT_DATE
RCUR.INIT_PMT_DATE

Recur

The following two fields allow you to change the total number of transfers to make and the recurring transfer period for a recurring scheduled transfer transaction. Valid values can be entered in these fields only if the Transfer Type field is set to the value R.

Total — The total number of transfers to make. The value in this field must be greater than the value in the Number of Transfers Made field.

Field Length: 1–4 numeric characters
Required Field: No
Default Value: No default value
Column Name: RCUR.TOT_PMT

Period — A code identifying the frequency of transfers. Valid values are as follows:

2W = Every two weeks
A = Annually (once a year)
MN = Monthly
Q = Quarterly (every three months)
S = Semi-annually (every six months)
WK = Weekly

Field Length: 1–2 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: RCUR.RECUR_PERIOD

From Acct — The new From Account Number. If a value is entered in the From Acct field, a value must also be entered in the Type field to the right of this field.

Field Length: 1–19 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: FUTR.FROM_ACCT_NUM
RCUR.FROM_ACCT_NUM

<ftyp> — The new From Account Type. A value can be entered in this field only if the From Acct field contains information.

Field Length: 1–6 alphanumeric characters
Required Field: Yes, if the From Acct field contains a value.
Default Value: No default value
Column Name: FUTR.FROM_ACCT_TYP
RCUR.FROM_ACCT_TYP

To Acct — The new To Account Number. If a value is entered in the To Acct field, a value must also be entered in the Type field to the right of this field.

Field Length: 1–19 alphanumeric characters
Required Field: No
Default Value: No default value
Column Name: FUTR.TO_ACCT_NUM
RCUR.TO_ACCT_NUM

<ttyp> — The new To Account Type. A value can be entered in this field only if the To Acct field contains information.

Field Length: 1–6 alphanumeric characters
Required Field: Yes, if the To Acct field contains a value.
Default Value: No default value
Column Name: FUTR.TO_ACCT_TYP
RCUR.TO_ACCT_TYP

Screen 2 Function Keys

The use of two function keys Scheduled Transfer Detail screen 2 differs from that specified for the standard CSR function keys explained in section 1. The use of these function keys is explained below.

The first column of information below shows the BASE24 keys. The second column describes the functions that can be accomplished with these function keys.

Key	Description
F6	Delete — Deletes the scheduled transfer currently displayed on the screen.
F8	Update — Updates the scheduled transfer currently displayed on the screen.

Screen 2

Scheduled Transfer Detail screen 2 displays current processing details for the scheduled transfer transaction, including the processing status and the current status of retry processing. Scheduled Transfer Detail screen 2 is shown below, followed by descriptions of its fields. The first eight fields from screen 1 are repeated on screen 2 for reference purposes. Only the fields that differ from screen 1 are described.

F16-Return

STI Tfr — The date on which the Scheduled Transaction Initiator process will next attempt to make a transfer for this scheduled transaction. This date may be different than the date displayed in the Transfer Date: Next field on screen 1 if the process was unable to complete the transaction successfully on the specified next transfer date.

The format (for example, YYYYMMDD) in which the date in this field is displayed is provided immediately above the STI Tfr field value on the screen.

Field Length: System-protected
Column Name: FUTR.STI_PMT_DATE

STI Req — The date and time when the Scheduled Transaction Initiator process requested a funds authorization for this transaction. The value in this field is transient and is displayed only during the Scheduled Transaction Initiator process's authorization cycle.

The format (for example, YYYYMMDD) in which the date in this field is displayed is provided immediately above the STI Tfr field value on the screen.

The time is always displayed in hh:mm:ss format.

Field Length: System-protected
Column Name: FUTR.STI_REQ_GMT

Processing Status — A code indicating the current processing status of this scheduled transfer transaction. Valid values are as follows:

␣ = Not started
PA = Pending authorization
RP = Retry processing is pending
RW = Waiting to retry
All others = Unknown

A text description of the processing status is displayed immediately to the right of the code value.

Note: You can only update transaction data, delete transactions, or skip a transfer period as long as the Scheduled Transaction Initiator process is not currently processing the transaction. If the status indicates the transaction is pending authorization or retry processing, the Scheduled Transaction Initiator process is currently processing the transaction and it cannot be altered. If the status indicates that processing has not started, is waiting to be retried, or is unknown, then the transaction can be altered.

Field Length: System-protected
Column Name: FUTR.PROCESSING_STAT

Tran Source

The following three fields describe the originating source for this transaction.

Type — A code indicating the originating source of this transaction. Valid values are as follows:

AD = Audio device (for example, an interactive voice response system)
IB = Inbound (customer service representative terminal)
PC = Personal computer
SP = Screen phone

Field Length: System-protected
Column Name: FUTR.TXN_SRC

Number — The transaction source number associated with this transaction.

Field Length: System-protected
Column Name: FUTR.TXN_SRC_NUM

Date — The date and time when the transaction source initiated this transaction.

The format (for example, YYYYMMDD) in which the date in this field is displayed is provided immediately above the STI Tfr field value on the screen.

The time is always displayed in HH:MM:SS format.

Field Length: System-protected
Column Name: FUTR.TXN_SRC_GMT

Retry

The following four fields describe any retry processing for the transaction.

Transient Count — The number of times the transaction has been retried due to a transient error condition. A transient error condition specifies a condition that typically exists for only a brief period of time and that can often be rectified without any operator intervention.

Field Length: System-protected
Column Name: FUTR.RETRY_CNT_TRANSIENT

NonTransient Count — The number of times the transaction has been retried due to a nontransient error condition. A nontransient error condition specifies a condition that may exist for an extended period of time (for example, insufficient funds) or may require operator intervention to rectify the condition.

Field Length: System-protected
Column Name: FUTR.RETRY_CNT_NONTRANSIENT

Next Processing Time — If the transaction is currently in a retry cycle, this is the date and time the system will next attempt to process the transaction.

The format (for example, YYYYMMDD) in which the date in this field is displayed is provided immediately below the Next Processing Time field value on the screen.

The time is always displayed in hh:mm:ss format.

Field Length: System-protected
Column Name: FUTR.RETRY_NEXT_PROCESSING_GMT

Last Action Code — A code indicating the processing outcome of the last retry attempt to process this transfer transaction. A description of the code is displayed immediately to the right of the field value. Refer to the ***BASE24 Remote Banking Transaction Processing Manual*** for descriptions of all possible action codes.

Field Length: System-protected
Column Name: FUTR.RETRY_LAST_RSP_CODE

Section 31

Statement Closing Download Response Screen

The Statement Closing Download Response screen is a BASE24-telebanking screen displayed when a statement closing download request is approved.

The Statement Closing Download Response screen overlays the bottom half of Authorization Request screen 1 in the one-sided set 3 format. This enables you to view the transaction request and response at the same time.

The Statement Closing Download Response screen lists closing balance transactions retrieved from a host. Up to five transactions can be displayed on the screen at a time.

The screen displays an action code and description indicating whether the transaction was approved or denied. If the transaction was denied, the reason for the denial is provided. An approval code is displayed if the transaction was approved.

Screen 1 Function Keys

The use of the following key varies on this screen from the standard function keys defined in section 1.

Key	Description
F9	More Information — Displays the next page of transactions for the account.

Screen 1

Statement Closing Download Response screen 1 is a BASE24-telebanking screen displayed when the statement closing download request transaction is approved. If this transaction is denied, the Authorization Response screen is displayed instead.

The Statement Closing Download Response screen overlays the bottom half of Authorization Request screen 1, one-sided, set 3 format. This enables you to view both the transaction request and response data at the same time.

The Statement Closing Download Response screen displays closing balances over a given period of time. Field values are provided by the host and are not stored in the BASE24 Remote Banking database.

Statement Closing Download Response screen 1 is shown below, followed by descriptions of its fields.

```

Section 32

Statement Download Response Screen

The Statement Download Response screen is a BASE24-telebanking screen displayed when a statement download request is approved.

The Statement Download Response screen overlays the bottom half of Authorization Request screen 1 in the one-sided set 3 format. This enables you to view the transaction request and response at the same time. Statement Download Response screen 1 has different formats for payment transactions and other transactions. Both screen formats are provided in this section.

The format of the Statement Download Response screen displayed depends on the first transaction returned in the specified statement period. If the first transaction is a payment transaction, the payment format of the screen is displayed, showing a single payment transaction. If the first transaction is a transaction other than a payment, the Statement Download Response screen for other transactions is displayed. This screen displays up to three transactions (other than payment transactions) in sequential order, until there is a payment transaction.

For example if a statement has a withdrawal, a deposit, a payment, and another withdrawal (posted in the order stated), the first screen displayed is the Statement Download Response screen, other format, with the first withdrawal and the deposit. The message MORE INFORMATION AVAILABLE is also displayed. Pressing the **F9** keys displays the next transaction, the payment, on Statement Download Response screen, payment format with the payment transaction information. The message MORE INFORMATION AVAILABLE is also displayed. Pressing the **F9** key again displays the final withdrawal transaction on the Statement Download Response screen, other format.

The Statement Download Response screen displays an action code and description indicating whether the transaction was approved or denied. If the transaction was denied, the reason for the denial is provided. An approval code is displayed if the if the transaction was approved.

Screen 1 Function Keys

The use of the following key varies on this screen from the standard function keys defined in section 1.

Key	Description
F9	More Information — Displays the next page of transactions for the account.

Screen 1, Payment Format

Statement Download Response screen 1 in the payments format is a BASE24-telebanking screen displayed when the statement download request transaction is approved and the first transaction in the statement period is a payment. If this BASE24-telebanking transaction is denied, the Authorization Response screen is displayed instead. If this BASE24-telebanking transaction is approved and the first transaction is not a payment, Statement Download Response screen 1 in the other transactions format is displayed.

Statement Download Response screen 1 in the payments format overlays the bottom half of Authorization Request screen 1.

The Statement Download Response screen in the payments format displays information about a single payment for an account in the specified period. Field values are provided by the host and are not stored in the BASE24 Remote Banking database.

Statement Download Response screen 1, payments format is shown below, followed by descriptions of its fields.

```

Field Length: System-protected
Data Name: Not applicable

ADDR — The street address of the vendor to which the payment was made.

Field Length: System protected
Data Name: Not applicable

CITY — The city where the vendor to which the payment was made resides.

Field Length: System-protected
Data Name: Not applicable

STATE — The state where the vendor to which the payment was made resides.

Field Length: System-protected
Data Name: Not applicable

POSTAL CODE — The postal or ZIP code of the vendor to which the payment was made.

Field Length: System-protected
Data Name: Not applicable

Screen 1, Other Format

The Statement Download Response screen in the other format is a BASE24-telebanking screen displayed when the statement download request transaction is approved and the first transaction in the statement period is a transaction other than a payment. If this BASE24-telebanking transaction is denied, the Authorization Response screen is displayed instead. If this BASE24-telebanking transaction is approved and the first transaction is a payment, the Statement Download Response screen for payments is displayed.

The Statement Download Response screen in the other format overlays the bottom half of Authorization Request screen.

The Statement Download Response screen, other format displays information about up to three transactions for an account in the specified period. Field values are provided by the host and are not stored in the BASE24 Remote Banking database.

Statement Download Response screen 1 in the other format is shown below, followed by descriptions of its fields.

```

APPROVAL CDE — The approval code assigned to the statement download transaction by the transaction authorizer. An approval code is a random number generated and displayed only when a transaction is approved. For denied transactions, this field is blank.

Field Length: System-protected
Data Name: Not applicable

POST DATE — The date, in YYMMDD format, this particular transaction was posted to the host.

Field Length: System-protected
Data Name: Not applicable

AMOUNT — The amount of this particular transaction in whole and fractional currency units. The value in this field is displayed in the currency for the transaction.

Field Length: System-protected
Data Name: Not applicable

DB/CR/OTHER ACCOUNT INFO — A three-part field consisting of a debit or credit indicator and the account number and type of a second account, if applicable.

The debit or credit indicator specifies whether the account was credited or debited or whether it was the *from* account or *to* account in a transfer. Valid values are as follows:

CREDIT = The account was credited the amount in the AMOUNT field.
DEBIT = The account was debited the amount in the AMOUNT field.
FROM = The account was the *from* account in a transfer transaction.
TO = The account was the *to* account in a transfer transaction.

If the debit or credit indicator contains a value of FROM or TO, the account number of the *from* account or *to* account and the account type (e.g., DDA for a checking account or SAV for a savings account) appear to the right of the indicator. These two parts of this field are blank if the debit or credit indicator contains the value CREDIT or DEBIT.

Field Length: System-protected

Data Name: Not applicable

CHECK NUMBER — The number of the check used in a debit transaction from a checking account.

Field Length: System-protected

Data Name: Not applicable

TXN ID — The unique identifier for the transaction that allows a client to detect duplicate transactions. This must be unique within the account.

Field Length: System-protected

Data Name: Not applicable

Section 33

Transaction History

The Transaction History screen is a BASE24-billpay screen that allows you to view summary historical data for all BASE24-billpay transactions (both financial and nonfinancial) previously processed for a customer. On this screen, you can display all transactions for the customer or only those scheduled payments and transfers that are considered to have been successfully paid or completed. Scheduled payments or transfers that do not complete successfully are not displayed as having been paid. Scheduled payments remitted by automated clearinghouse (ACH) are not considered to be paid until after the number of days specified by the BP-ACH-PAID-DAYS param in the Logical Network Configuration File (LCONF) have elapsed since the payment transaction was approved and logged to the History Table (HIST). You can select individual transactions for which detailed information is displayed by placing the cursor on the transaction entry and pressing a function key.

Note: You can view only transactions logged to the HIST using this screen. Refer to section 1 for a list of transactions that are not logged to the HIST. Transactions logged to the HIST are retained for a configurable number of days before they are archived and deleted from the HIST. After a transaction is archived, it can no longer be viewed from this screen unless it is placed back in the HIST during refresh processing.

The Transaction History screen is displayed when you select the HISTORY INQUIRY or LAST PAYMENTS/TRANSFERS transaction on the Transaction Menu.

The Transaction History screen allows you to scroll forward or backward through a customer's transactions, using a full or partial transaction reference number or the next business start date as a starting point. Transactions are then ordered by transaction reference number or next action date as selected. The **Shift-F7** and **Shift-F8** keys allow you to view the previous three transactions or the next three transactions, respectively, starting with the current value of the Query Reference Number or Query Next Business Start Date field.

The **F13** key allows you to toggle between a display of all transactions for a customer and a display of only payments and transfers that are considered to have been paid or completed. The screen defaults to a display of paid transactions when you first enter the screen.

You can display detailed information for an individual transaction on the Transaction History Detail screen by placing the cursor next to the transaction entry and pressing the **F1** key.

Screen 1 Function Keys

The use of four function keys on Transaction History screen 1 differs from that specified for the standard CSR function keys explained in section 1. The use of these function keys is explained below.

The first column of information below shows the BASE24 keys. The second column describes the functions that can be accomplished with these function keys.

Key	Description
F1	Transaction Detail — Selects the transaction displayed on the same line of the screen as the cursor and returns this information to the Transaction History Detail screen.
Shift-F7	Previous — Retrieves the previous three transactions for this customer. A value in the Query Reference Number field when these keys are pressed determines the order in which transactions are arranged, as follows: • If the Query Reference Number field contains a value, this value is used as a starting point to select the previous three transactions displayed. • If the Query Reference Number field is blank, the value in the Rfrnce Number field or the BusDate field for the first transaction currently displayed is used to select the previous three transactions displayed, depending on the key path last used. The Query Reference Number or Query Start Date fields define the selected key path for this screen. Use either the Query Reference Number field at least once with the Shift-F7 keys or either of these fields at least once with the Shift-F8 keys, before the value of the Rfrnce Number or BusDate field is used as the selected key path with the Shift-F7 keys. After a key path is selected, both the Query fields can be blank when you press the Shift-F7 keys. The Query Start Date field must always be blank when you press the Shift-F7 keys.

Key	Description
Shift-F8	Next — Retrieves the next three transactions for this customer. Values in the Query Reference Number and Query Start Date fields when these keys are pressed specify the order in which transactions are arranged, as follows: • If the Query Reference Number field contains a value and the Query Start Date field is blank, this value is used as a starting point to select the next three transactions displayed. • If the Query Start Date field contains a value and the Query Reference Number field is blank, this value is used as a starting point to select the next three transactions displayed. • If both the Query Reference Number and Query Start Date fields are blank, the value in the Rfrnce Number field or the BusDate field for the last transaction currently displayed is used to select the next three transactions displayed, depending on the key path last used. The Query Reference Number or Query Start Date fields define the selected key path for this screen. Use either the Query Reference Number field at least once with the Shift-F7 keys or either of these fields at least once with the Shift-F8 keys, before the value of the Rfrnce Number or BusDate field is used as the selected key path with the Shift-F8 keys. After a key path is selected, the Query fields can be blank when you press the Shift-F8 keys.

ACCT NUMBER — An application account number for this customer. An account number is displayed in this field only if one was entered and retrieved during customer verification processing. Otherwise, this field is blank.

Field Length: System-protected
Column Name: CACT.ACCT

NAME — The customer's family name or last name, followed by the customer's given name or first name, and the customer's middle initial. The name displayed in these fields was retrieved during customer verification processing.

Field Length: System-protected
Column Names: PIT.NAM_FMLY
 PIT.NAM_GIVEN
 PIT.NAM_M_I

QUERY

The following two fields allow you to peruse transactions for this customer by entering a transaction reference number in the Number field or business date in the start Date field and pressing the **Shift-F7** or **Shift-F8** keys. The **Shift-F7** and **Shift-F8** keys allow you to view the previous three transactions or the next three transactions, respectively, based on the data entered. Refer to the "Screen 1 Function Keys" discussion in this section for more information on how these keys are used.

Ref Number — A unique system-generated number used to reference historical data for this transaction for the customer's ID.

Field Length: 6 numeric characters
Required Field: No
Default Value: No default value
Column Name: HIST.REF_NUM

Start Date — A date from which to start searching for transactions that were processed before or after this date. The format that the date is to be entered in is shown immediately following the the field.

Field Length: 8 numeric characters
 Required Field: No
 Default Value: No default value
 Column Name: HIST.PMT_DATE

Mode — A filter for the type of transactions to be displayed. Valid values are as follows:

A-APPRV = Returns all transactions that were approved.
 A-BOTH = Returns all transactions that were approved or denied.
 A-DENY = Returns all transactions that were denied.
 F-APRV = Returns all financial transactions that were approved.
 F-BOTH = Returns all financial transactions that were approved or denied.
 F-DENY = Returns all financial transactions that were denied.

A system-protected text field description follows this field.

Field Length: 1 to 6 alphanumeric characters
 Required Field: No
 Default Value: No default value
 Column Name: Not applicable

<M> — The current mode of display. The value contained in the Mode field is transferred to this field when a successful display is returned. Valid values are the same as for the Mode field.

Field Length: System-protected
 Column Name: Not applicable

Tran Type — A code identifying the type of transaction performed. The code can be reserved, user defined, or for ACI use only. The reserved values are as follows:

3H = Customer vendor list inquiry
 3J = Scheduled payments list inquiry
 3K = Scheduled transfers list inquiry
 3L = History inquiry – payments and transfers
 3M = Scheduled transactions list inquiry
 4A = Transfer – future
 4B = Transfer – recurring
 5A = Payment – future
 5B = Payment – recurring
 9A = Schedule payment – immediate
 9B = Schedule payment – future

9C = Schedule payment – recurring
9D = Schedule transfer – future
9E = Schedule transfer – recurring
9F = Scheduled payment delete
9G = Scheduled transfer delete
9H = Scheduled payment update
9J = Scheduled transfer update
9K = Customer add
9L = Customer inquiry
9M = Customer update
9N = Customer vendor add
9P = Customer vendor deactivate
9Q = Customer vendor update
9R = Master vendor list inquiry
9S = Master vendor add (internal transaction)
9T = Customer vendor request mailing
9V = Loan application
9W = Miscellaneous request
9X = History inquiry – all transactions
B0 = Customer account list inquiry (internal transaction)
B1 = Bank list inquiry
B2 = Bank branch list inquiry
B3 = Cancel immediate payment (internal transaction)
B4 = Miscellaneous requests inquiry
B5 = Customer account add
B6 = Customer account activate
B7 = Customer account deactivate
B8 = Customer account delete
B9 = Customer account update
BB = Customer activate
BC = Customer deactivate
BD = Customer vendor activate
BE = Customer vendor mask verify inquiry

Field Length: System-protected
Column Name: HIST.TXN_TYP

From Account — The number of the customer account debited or to be debited in a payment or transfer transaction. This is the account from which the payment or transfer is made.

Field Length: System-protected
Column Name: HIST.FROM_ACCT_NUM

To:Acct or AcctwVend — The number of the customer account credited or to be credited in a payment or transfer transaction. For transfers, this is the customer account to which funds are to be transferred. For payments, this is the customer's account with the vendor to receive the payment.

Field Length: System-protected
Column Names: HIST.TO_ACCT_NUM (for transfers only)
HIST.ACCT_WITH_VEND (for payments only)

Vendor Name — For payment transactions, this field displays the name of the vendor to receive the payment.

Field Length: System-protected
Column Name: VNDR.VEND_NAME

Rfrnce — A unique system-generated number used to reference historical data for this transaction for this customer. Every transaction processed by the system for this customer is assigned a unique reference number.

Field Length: System-protected
Column Name: HIST.REF_NUM

CstVnd Number — For payment transactions, this field displays the number of the customer vendor to receive the payment.

Field Length: System-protected
Column Name: HIST.CUST_VEND_NUM

Tran Type Description — Displays a description for this transaction type. See the Tran Type field description above for a list of all possible transaction type descriptions.

Field Length: System-protected
Column Name: HIST.TXN_TYP

Completion Status — The first eight characters of the text describing the action taken by the system for this transaction. This is the text associated with the action code indicating the outcome of processing for the transaction.

Refer to the ***BASE24 Remote Banking Transaction Processing Manual*** for a list of all possible action codes. The text describing each action code must be configured in the Response Text Table (RTXT). Refer to the ***BASE24-billpay Tables Maintenance Manual*** for more information on the RTXT.

Field Length: System-protected
Column Name: RTXT.INTRN_TXT

OrigRfrnce — The original reference number for this transaction, if it is different from the current reference number. If the original reference number is the same as the current reference number, this field displays all blanks.

Field Length: System-protected
Column Name: HIST.ORIG_REF_NUM

Amount — For financial transactions, this field displays the amount of the payment or transfer in whole and fractional currency units (for example, U.S. dollars and cents). A decimal point can be displayed if the amount includes fractional currency units.

Field Length: System-protected
Column Name: HIST.AMT

BusDate — The date on which funds were collected from the *from* account for financial transactions. For nonfinancial transactions, this is the date on which the transaction was processed.

The format (for example, YYYYMMDD) in which the date in this field is displayed is provided below the EntryDate field caption on the screen.

Field Length: System-protected
Column Name: HIST.BUS_DATE

EntryDate — The date on which this transaction was entered into the system.

The format (for example, YYYYMMDD) in which the date in this field is displayed is provided below the EntryDate field caption on the screen.

Field Length: System-protected
Column Name: HIST.BP_DATE

Section 34

Transaction History Detail

The Transaction History Detail screen is a BASE24-billpay screen that allows you to view detailed historical information for an individual BASE24-billpay transaction performed on behalf of a customer. The Transaction History Detail screen is displayed when you select an individual transaction on the Transaction History screen and press the **F1** key. The Transaction History Detail screen has two pages, as follows:

- Screen 1 displays vendor and scheduling information.
- Screen 2 displays the processing outcome of the transaction.

Screen 1

Transaction History Detail screen 1 allows you to view details of a previously processed transaction for a customer. Transaction History Detail screen 1 is shown below, followed by descriptions of its fields.

```

BASE24-CORE  TRAN HISTORY DETAIL      LLLL      YY/MM/DD  hh:mm  01 OF 02

BANK — The name of the customer’s financial institution. The value in this field was retrieved during customer verification processing.

Field Length: System-protected
Column Name: BANK.BANK_NAME

CUSTOMER ID — The unique identification number assigned to the customer. The value in this field was retrieved during customer verification processing.

Field Length: System-protected
Column Name: CSTT.PAN

ACCT NUMBER — An application account number for this customer. An account number is displayed in this field only if one was entered and retrieved during customer verification processing. Otherwise, this field is blank.

Field Length: System-protected
Column Name: CACT.ACCT

NAME — The customer's family name or last name, followed by the customer's given name or first name, and the customer's middle initial. The name displayed in these fields was retrieved during customer verification processing.

Field Length: System-protected
Column Names: PIT.NAM_FMLY
PIT.NAM_GIVEN
PIT.NAM_M_I

Ref Num — A unique system-generated number used to reference historical data for this transaction for this customer. Every transaction processed by the system for this customer is assigned a unique reference number.

Field Length: System-protected
Column Name: HIST.REF_NUM

Tran Type — A code indicating the type of transaction processed. The following list shows you each of the possible reserved transaction type codes that can appear in this field and the corresponding description text displayed to the right of the code value. User-defined codes can also be displayed.

3H = Inquire customer vendor list
3J = Inquire scheduled payment list
3K = Inquire scheduled transfer list
3L = Inquire last payments/transfers list
3M = Inquire scheduled transactions list
4A = Do scheduled transfer future
4B = Do scheduled transfer recurring
5A = Do scheduled payment future
5B = Do scheduled payment recurring
9A = Schedule payment
9B = Schedule payment future
9C = Schedule payment recurring
9D = Schedule transfer future
9E = Scheduled transfer recurring
9F = Delete scheduled payment

9G = Delete scheduled transfer
9H = Update scheduled payment
9J = Update scheduled transfer
9K = Add/activate customer signup
9L = Inquire customer information
9M = Update customer information
9N = Add customer vendor
9P = Delete customer vendor
9Q = Update customer vendor
9R = Inquire master vendor list
9S = Add master vendor
9T = Request customer vendor list
9V = Add loan application
9W = Add miscellaneous request
9X = Inquire Billpay history
B0 = Customer account list inquiry (internal transaction)
B0 = Customer account list inquiry (internal transaction)
B1 = Bank list inquiry
B2 = Bank branch list inquiry
B3 = Cancel immediate payment (internal transaction)
B4 = Miscellaneous requests inquiry
B5 = Customer account add
B6 = Customer account activate
B7 = Customer account deactivate
B8 = Customer account delete
B9 = Customer account update
BB = Customer activate
BC = Customer deactivate
BD = Customer vendor activate
BE = Customer vendor mask verify inquiry

Field Length: System-protected

Column Name: HIST.TXN_TYP

BP Entry — The date and time this transaction was entered into the system (that is, was received by the Billpay Server process).

The format (for example, YYYYMMDD) in which the date in this field is displayed is provided below the BP Entry field value on the screen.

The time is always displayed in hh:mm format.

Field Length: System-protected
Column Name: HIST.BP_GMT

From Account

The following three fields describe the *from* account for this transaction.

FIID — The FIID of the financial institution owning this account. The FIID is used throughout BASE24 products to identify each BASE24 institution.

Field Length: System-protected
Column Name: HIST.FROM_FIID

Account Number — The number of the customer account debited in a payment or transfer transaction. This is the account from which a payment or transfer is made.

Field Length: System-protected
Column Name: HIST.FROM_ACCT_NUM

Type — An abbreviated description of the account type. The following default account type values are provided with your system. User-defined values may also be displayed.

NONE	= No account
SAV	= Savings account
SAV1	= Savings account
SAV2	= Savings account
SAV3	= Savings account
SAV4	= Savings account
SAV5	= Savings account
SAV6	= Savings account
DDA	= Demand deposit account
DDA1	= Demand deposit account
DDA2	= Demand deposit account
DDA3	= Demand deposit account
DDA4	= Demand deposit account
DDA5	= Demand deposit account
DDA6	= Demand deposit account
DDA7	= Demand deposit account
DDA8	= Demand deposit account
CR	= Credit account

CR1 = Credit account
CR2 = Credit account
CR3 = Credit account
CR4 = Credit account
CR5 = Credit account
CR6 = Credit account
CR7 = Credit account
LOCR = Line of credit
CD = Certificate
IRA = Retirement account
NOW = Interest-bearing checking account
CMRCL = Commercial loan
INSTL = Installment loan
MRTGL = Mortgage loan

Field Length: System-protected
Data Name: ATT.ALTKEY.ACCT-TYP-NAM

Amt — The amount of the payment or transfer in whole and fractional currency units (for example, U.S. dollars and cents). A decimal point can be displayed if the amount includes fractional currency units.

Field Length: System-protected
Column Name: HIST.AMT

Scheduled As — Indicates whether the transaction is an immediate, future, or recurring transaction. Valid values are as follows:

IMMEDIATE = An immediate scheduled payment transaction.
FUTURE = A future scheduled payment or transfer transaction.
RECURRING = A recurring scheduled payment or transfer transaction.
N/A = Not applicable. This is an unscheduled transaction.
UNKNOWN = The type of scheduled transaction is not known.

Field Length: System-protected
Column Name: HIST.AMT

Orig Ref Num — The original reference number for this transaction, if it is different from the current reference number. If the original reference number is the same as the current reference number, this field displays all blanks. For transfers and payments that were scheduled, this is the reference number of the original scheduled transaction.

Field Length: System-protected
Column Name: HIST.ORIG_REF_NUM

To Account

The following three fields describe the *to* account for this transaction.

FIID — The FIID of the financial institution owning this account. The FIID is used throughout BASE24 products to identify each BASE24 institution.

Field Length: System-protected
Column Name: HIST.TO_FIID

Account Number — The number of the customer account credited in a transfer transaction. This is the account to which a transfer is made.

Field Length: System-protected
Column Name: HIST.TO_ACCT_NUM

Type — An abbreviated description of the account type. Refer to the previous Type field description for the From Account for descriptions of all the default account types provided with your system.

Field Length: System-protected
Data Name: ATT.ALTKEY.ACCT-TYP-NAM

To CstVnd

The following three fields contain customer vendor information associated with a payment transaction.

Num — The customer vendor number identifying the customer vendor.

Field Length: System-protected
Column Name: CVND.CUST_VEND_NUM

Name — The name of the customer vendor. The vendor number assigned to the vendor in the Vendor Registry is displayed to the right of the vendor name in parentheses.

Field Length: System-protected
Column Names: VNDR.VEND_NAME
HIST.VEND_NUM

Acct With Vend — The customer's account number with this customer vendor. This is the number of the account to which a payment transaction is posted or credited.

Field Length: System-protected
Column Name: HIST.ACCT_WITH_VEND

Tran Source

The following three fields identify the source of this transaction.

Type — A code indicating the type of device or program used to enter this transaction. User-defined values other than the following reserved values also are valid:

AD = Audio device (for example, an interactive voice response system)
BL = BASE24-billpay Billing Server process
IB = Inbound (customer service representative terminal)
PC = Personal computer
SP = Screen phone

A value of all blanks is considered a user-defined value.

Field Length: System-protected
Column Name: HIST.TXN_SRC

Number — A unique number assigned by the transaction source device or software to this transaction.

Field Length: System-protected
Column Name: HIST.TXN_SRC_NUM

Date — The date and time this transaction was entered into the system at the transaction source or device. The time is displayed in local civil time (LCT).

The format (for example, YYYYMMDD) in which the date in this field is displayed is provided to the right of the Date field value on the screen.

The time is always displayed in hh:mm:ss format.

Field Length: System-protected
Column Name: HIST.TXN_SRC_LCT

Screen 2

Transaction History Detail screen 2 allows you to view the processing disposition of an individual transaction for a customer. Transaction History Detail screen 2 is shown below, followed by descriptions of its fields.

```

BASE24-CORE  TRAN HISTORY DETAIL      LLLL      YY/MM/DD  hh:mm  02 OF 02

      BANK:      CUSTOMER ID:

```

Ref Num — A unique system-generated number used to reference historical data for this transaction for this customer. Every transaction processed by the system for this customer is assigned a unique reference number.

Field Length: System-protected
Column Name: HIST.REF_NUM

Collection Status — The status for the collection of funds from the *from* account for this transaction, if applicable. A description of the completion status is displayed in the Completion field. User-defined values other than the following reserved values also are valid.

COMPLETE = Collection of customer funds for this transaction is complete.
FAILED = The collection of customer funds for this transaction failed.
INITIAL = Initial. The collection of customer funds for this transaction has not yet begun.

PENDING = The collection of customer funds for this transaction is pending.
UNKNOWN = The status of collection of customer funds for this transaction is not known.
b = Displayed for all nonfinancial transactions. A value of all blanks is considered to be user-defined.

Field Length: System-protected
Column Name: HIST.COLL_STAT

Partition Num — A number indicating the History Table (HIST) partition in which this transaction is stored. The HIST is partitioned for performance reasons.

Field Length: System-protected
Column Name: HIST.PARTITION_NUM

Completion — A text description of the action code displayed in the Action Code field. This is the description configured for the action code in the Response Text Table (RTXT). Refer to the *BASE24-billpay Table Maintenance Manual* for more information on the RTXT.

Field Length: System-protected
Column Name: RTXT.INTRN_TXT

Action Code — A code indicating the processing outcome of this transaction. Refer to the *BASE24 Remote Banking Transaction Processing Manual* for a list of all possible action codes.

Field Length: System-protected
Column Name: HIST.RSP_CODE

Approval Code — The approval code assigned to the transaction by the transaction authorizer. An approval code is a random number generated for an approved transaction. For denied transactions, this field is blank.

Field Length: System-protected
Column Name: HIST.AUTH_APPRV_CODE

Reversal Reason — A code used by the transaction authorizer to indicate the reason this transaction is reversed. If the transaction is not reversed, this field is blank.

Field Length: System-protected
Column Name: HIST.RVSL_RSN

Business Date — The date on which funds were collected from the *from* account for financial transactions. For nonfinancial transactions, this is the date on which the transaction was processed.

The format (for example, YYYYMMDD) in which the date in this field is displayed is provided immediately above the Business Date field value on the screen.

Field Length: System-protected
Column Name: HIST.BUS_DATE

History Date — The date and time on which this transaction was written to the History Table (HIST).

The format (for example, YYYYMMDD) in which the date in this field is displayed is provided immediately above the Business Date field value on the screen.

The time is always displayed in hh:mm:ss format.

Field Length: System-protected
Column Name: HIST.HIST_GMT

Rqstd Tran Date — The date the customer requested this transaction to be performed.

The format (for example, YYYYMMDD) in which the date in this field is displayed is provided immediately above the Business Date field value on the screen.

Field Length: System-protected
Column Name: HIST.PMT_DATE

Remitted

The following three fields describe the type and status of remittance generated for a payment transaction.

Date — The date on which remittance was initiated to a vendor.

The format (for example, YYYYMMDD) in which the date in this field is displayed is provided immediately above the Business Date field value on the screen.

Field Length: System-protected
Column Name: HIST.REMIT_BUS_DATE

Status — The current status of remittance processing. Valid values are as follows:

- | | | |
|-----------|---|---|
| INITIAL | = | Remittance is waiting to be sent out by the Remittance Generator process. |
| CLEARED | = | The automated clearinghouse (ACH) transaction or check used to pay the vendor has cleared the account from which the payment was issued. This implies that the vendor has been credited with funds for the payment. |
| COMPLETED | = | The Billpay Server process has received acknowledgment that the remittance was successfully sent to the vendor. When this status is displayed, the Remit Ack fields will contain values. |

FAILED	= The Billpay Server process was unable to generate remittance for this payment transaction. This value can also be used to indicate that the vendor acknowledged that they failed to receive the payment or that a third-party processor acknowledged that generation of the required remittance failed. In either case, the Remit Ack: Paid Date field indicates the date the acknowledgment was received.
SENT OUT	= The Remittance Generator process has processed this transaction and made an entry in the appropriate Remit File.
UNKNOWN	= The current status of remittance processing for this payment transaction is not known.
␣	= Displayed for all nonpayment transactions. A value of all blanks is considered to be user-defined.

For a payment remitted by ACH processing, the typical sequence of status values for the life of the payment transaction are as follows: INITIAL, SENT OUT, and CLEARED; or INITIAL, SENT OUT, and FAILED.

For a payment remitted by check, the typical sequence of status values for the life of the payment transaction are as follows: INITIAL, SENT OUT, COMPLETED, and CLEARED.

The exact sequence of remittance status values depends on the acknowledgments that can be returned from a third-party processor or the vendor.

Field Length: System-protected
Column Name: HIST.REMIT_STAT

Type — A code indicating the type of remittance generated for a payment transaction. Valid values include the following:

ACH = Automated Clearinghouse (ACH) payment
CGP = Group-item check
CIT = Single-item check
␣ = Displayed for all nonpayment transactions

This field can display other values for user-defined remittance types.

Field Length: System-protected
Column Name: HIST.REMIT_TYP

Remit Ack

The following three fields describe the remittance acknowledgment for a payment transaction. Values are displayed in these fields when the remittance Status field displays a value of COMPLETED or FAILED.

Paid Date — The date on which the vendor was actually paid, rather than the date on which the Remittance Generator process generated the remittance for a payment transaction.

The format (for example, YYYYMMDD) in which the date in this field is displayed is provided immediately above the Business Date field value on the screen.

Field Length: System-protected
Column Name: HIST.REMIT_ACK_DATE

Number — A number used on the remittance generated for a payment transaction, such as a check number.

Field Length: System-protected

Rcvd Ack Date — The date on which an outside remitter (for example, an automated clearinghouse) notified the BASE24-billpay system of the date the vendor was actually paid (Paid Date field) and the number used on the remittance (Number field).

The format (for example, YYYYMMDD) in which the date in this field is displayed is provided immediately above the Business Date field value on the screen.

Field Length: System-protected
Column Name: HIST.REMIT_ACK_RCVD_GMT

Vendor Specific Data — Any vendor-specific data that was entered for a payment transaction.

Field Length: System-protected
Column Name: HIST.VEND_SPECIFIC_DATA

Billing Text — Any billing text associated with this transaction. This is typically the text that will appear on the customer's billing statement from the customer's financial institution.

Field Length: System-protected
Column Name: HIST.BILL_TXT

Section 35

Transaction Menu

The Transaction Menu is a BASE24-telebanking menu that allows you to select individual BASE24-telebanking and BASE24-billpay transactions to be performed. This menu displays all the transactions you are allowed to perform at a customer service representative (CSR) terminal. A transaction must be defined to the Transaction Type By Source Code Table (TTSC) before it will appear on this menu. Refer to the *BASE24 Core Files and Tables Maintenance Manual* for instructions on using the TTSC.

The Transaction Menu is displayed when you press the **F4** key on any CSR screen, unless a PIN change or PIN verify transaction is required and has not yet been performed. In this case, Authorization Request screen 1 (PIN change or PIN verify) is displayed instead. Required PIN change and PIN verify transactions must be performed before you can perform any other transaction for the customer.

When you select a BASE24-telebanking transaction from the Transaction Menu, either the Transaction Selection screen or the appropriate Authorization Request screen is displayed. The Transaction Selection screen allows you to select the specific account types (for example, DDA for checking accounts and SAV for saving accounts) of the accounts on which the transaction is to be performed. For the account list inquiry, PIN change, and PIN verify transactions, the Transaction Selection screen is not displayed because the account type is irrelevant to these transactions. For these transaction types, the appropriate Authorization Request screen is displayed instead.

When you select a BASE24-billpay transaction from the Transaction Menu, the initial screen required to perform the transaction is displayed.

Selecting Transactions

To select a transaction, either position the cursor next to the transaction on the menu and press the **F1** key, or enter the number of the transaction in the ENTER TRANSACTION NUMBER field and press the **F1** key. Either the initial screen required to execute the selected transaction or the Transaction Selection screen is displayed.

The table provided below indicates the initial screen displayed for each of the reserved BASE24-telebanking, Enhanced Telebanking, and BASE24-billpay transactions you can select on the Transaction Menu. These transactions are defined in default TTSC rows. The first column of the table shows you the transactions reserved for the default TTSC rows. Default transactions that are available only with the Enhanced Telebanking application or the BASE24-billpay product are identified with a check mark (✓) in the Enhanced TB and BP columns of the table, respectively. Default transactions that are available with the BASE24-telebanking product only or with either the Enhanced Telebanking application or BASE24-billpay product do not have a check mark in either the Enhanced TB or BP columns. The fourth column shows you the name of the screen displayed when you select each transaction on the Transaction Menu. The entries in this table are arranged in alphabetical order by the transaction description configured for each transaction in the default TTSC.

Note: The following six BASE24-billpay transactions also can be displayed at the end of the menu selections; however, these transactions are performed automatically by the system when you access certain screens and functions and cannot be selected. If you attempt to select one of these transactions from the Transaction Menu, you will receive an error message.

- INQUIRE ACCOUNT LIST
- INQUIRE BANK LIST
- INQUIRE BANK BRANCH LIST
- CANCEL IMMEDIATE PAYMENT
- INQUIRE MISCELLANEOUS REQUEST
- ADD/UPDATE CUST SIGNUP ACCTS

If more transactions exist than can fit on a single page of the Transaction Menu, a message indicating that more transactions are available is displayed near the bottom of the screen. Otherwise, a message indicating that no more transactions are available is displayed. A total of up to three pages of transaction selections can exist. To view the next page of transaction selections, press the **Shift-F8** keys. To view the previous page of transaction selections, press the **Shift-F7** keys.

Function Keys

The use of three function keys on the Transaction Menu differs from that specified for the standard CSR function keys explained in section 1. The use of these function keys is explained below.

The first column of information below shows the BASE24 keys. The second column describes the function that can be accomplished with these function keys.

Key	Description
F1	Select Transaction Type — Selects the transaction identified by the current cursor position or the transaction type number entered in the ENTER TRANSACTION NUMBER field. Either the first screen required to execute the selected transaction or the Transaction Selection screen is displayed.
Shift-F7	Previous Transaction Types — Displays the previous page of transaction selections, if more transactions exist.
Shift-F8	More Transaction Types — Displays the next page of transaction selections, if more transactions exist.

Transaction Menu

The Transaction Menu allows you to select an individual transaction to be performed on behalf of the customer. Different transaction selections appear on the Transaction Menu, depending on whether both the BASE24-telebanking and BASE24-billpay products are installed or if only the BASE24-telebanking product is installed.

The order in which transactions appear on the screen is configurable in the TTSC, according to the values in the POSITION field for each TTSC row. If the value of the POSITION field is the same for multiple TTSC rows, then the transactions are arranged in order of TRANSACTION TYPE field values. The following examples show you how the Transaction Menu appears for the default TTSC rows provided by ACI.

Place the cursor to the left of the transaction and press the **F1** key to select the transaction. The initial screen required to perform the selected transaction is displayed.

Both Products Installed

The following examples of menu screens show the Transaction Menu screens with the BASE24-telebanking and the BASE24-billpay products installed. Any user-defined transactions configured to the TTSC will also appear on this menu.

The Transaction Menu (pages 1 and 2) is shown below and on the following page, followed by descriptions of its fields.

Section 36

Transaction Selection

The Transaction Selection screen is a BASE24-telebanking screen that is used to select the specific account types on which a BASE24-telebanking transaction is to be performed. By specifying the account type, the system can automatically determine the customer account on which the transaction is to be performed without a specified account number or account qualifier.

This screen is displayed for all the BASE24-telebanking transactions selected on the Transaction Menu with more than one account type configured in the Processing Code Definition File (PCDF). The Transaction Selection screen is not displayed for the account list inquiry, PIN change, and PIN verify transactions because the type of account is irrelevant to these transactions.

The Transaction Selection screen displays the transaction descriptions for all of the records in the PCDF with a transaction code matching the transaction selected on the Transaction Menu. If a transaction description is not configured in the PCDF for the selected transaction, it will not appear as an entry on the Transaction Selection screen.

When you select a transaction by account type on the Transaction Selection screen (for example, AVAIL FUNDS INQUIRY SAV), the system automatically determines which of the customer's accounts configured to the system are of the type requested when you authorize the transaction. This saves the time of having to obtain the account number or account qualifier from the customer and entering this information to perform the transaction.

If two or more accounts exist in the system with the same account type, either enter the account number or account qualifier to uniquely identify the account before you authorize the transaction, or the system will display a list of all accounts available for the type requested on the Account Selection screen—if multiple account selection is enabled—when you attempt to authorize the transaction. You can then select the individual accounts on which the transaction is to be performed from the list.

When you select a transaction without an account type on the Transaction Selection screen (for example, AVAIL FUNDS INQUIRY), you must provide the account numbers or account qualifiers when you authorize the transaction. The system then searches for accounts in the system that match the customer's ID, account number or account qualifier, and a particular account status to determine the accounts used in the transaction. If the customer has multiple accounts with the same account type range and account number, but no account qualifiers, the system again checks the account status to determine the accounts to use in the transaction. For detailed information on the search strategies used in these situations, refer to the ***BASE24 Remote Banking Transaction Processing Manual***.

Selecting Transactions and Account Types

To select a transaction and account types on the Transaction Selection screen, either position the cursor next to the transaction on the screen and press the **F1** key, or enter the number of the transaction in the ENTER TRANSACTION NUMBER field and press the **F1** key. The initial Authorization Request screen required to execute the selected transaction will be displayed.

The table below indicates the initial screen displayed for each of the possible reserved BASE24-telebanking transactions configured in default PCDF records you can select on this screen. The first column shows all of the possible reserved BASE24-telebanking transactions configured in default PCDF records. The second column shows the type of Authorization Request screen displayed when that transaction is selected.

Transaction Selected	Screen Displayed
AVAIL FUNDS INQUIRY (no account types)	Authorization Request screen 1 (one-sided, set 1)
AVAIL FUNDS INQUIRY (one account type)	Authorization Request screen 1 (one-sided, set 1)
AVAIL FUNDS INQUIRY (two account types)	Authorization Request screen 1 (dual available funds inquiry)
CHECK CLEARANCE INQUIRY (no account type or one account type)	Authorization Request screen 1 (check clearance inquiry)
CHECK STOP PAYMENT ADD	Authorization Request screen 1 (check stop payment)
LAST COUNT CHECK (no account type or one account type)	Authorization Request screen 1 (one-sided, set 2)
LAST COUNT CREDIT (no account type or one account type)	Authorization Request screen 1 (one-sided, set 2)
LAST COUNT DB/CR (no account type or one account type)	Authorization Request screen 1 (one-sided, set 3)
LAST COUNT DEBIT (no account type or one account type)	Authorization Request screen 1 (one-sided, set 2)

Transaction Selected	Screen Displayed
LAST COUNT SOURCE (no account type or one account type)	Authorization Request screen 1 (last source inquiry)
LAST COUNT TRANSFER (no account type or one account type)	Authorization Request (one-sided, set 1)
STMT CLOSING DOWNLOAD INQ	Authorization Request (one-sided, set 3)
STMT DOWNLOAD INQ	Authorization Request (one-sided, set 3)
TRANSFER IMMED (no account type or two account types)	Authorization Request screen 1 (transfer or user-defined)

If more transactions and account types exist than can fit on a single page of the Transaction Selection screen, a message indicating that more transactions are available is displayed near the bottom of the screen. A total of up to three pages of transactions and account types can exist. To view the next page of transaction and account type selections, press the **Shift-F8** key. To view the previous page of transaction and account type selections, press the **Shift-F7** key.

From the Transaction Selection screen you can also display the Customer Verify screen to change customers or the Transaction Menu to change transactions by pressing the appropriate function key.

Screen 1 Function Keys

The use of three function keys on Transaction Selection screen 1 differs from that specified for the standard CSR function keys explained in section 1. The use of these function keys is explained below.

The first column of information below shows the BASE24 keys. The second column describes the functions that can be accomplished with these function keys.

Key	Description
F1	Select Transaction — Selects the transaction and account types identified by the current cursor position or the transaction number entered in the ENTER TRANSACTION NUMBER field. The appropriate Authorization Request screen is displayed.
Shift-F7	Previous Page — Displays the previous page of transaction and account type selections, if more exist.
Shift-F8	More Transactions — Displays the next page of transaction and account type selections, if more exist.

Screen 1

Transaction Selection screen 1 allows you to select the particular account types to be used when performing a BASE24-telebanking transaction. The transaction and account type selections displayed on this screen are determined by the transaction you selected on the Transaction Menu that caused Transaction Selection screen 1 to be displayed.

The following Transaction Selection screen 1 example shows you how the reserved BASE24-telebanking transactions and account types from the PCDF appear on the Transaction Selection screen when you select the balance inquiry (for example, BAL INQUIRY) transaction type on the Transaction Menu. Each entry displayed is configured in the TRANSACTION DESCRIPTION field of a PCDF record.

Place the cursor to the left of the transaction to be selected. When the cursor is placed in this field and you press the **F1** key, the initial screen required to perform the selected transaction is displayed.

For a list of all transaction descriptions that can appear for reserved BASE24-telebanking transaction types defined in default PCDF records, refer to the PCDF description in the ***BASE24 Core Files and Tables Maintenance Manual***.

Transaction Selection screen 1 is shown below, followed by a description of its fields.

Section 37

Vendor Detail

The Vendor Detail screen allows you to view detailed information for a particular vendor selected on the Vendor Registry screen.

This screen can be helpful when you need further information to identify a vendor when adding a customer vendor on behalf of a customer.

You can access the Vendor Detail screen by selecting a vendor entry on the Vendor Registry screen and pressing the **F13** key. You can return to the Vendor Registry screen by pressing the **F16** key.

Screen 1

Vendor Detail screen 1 displays vendor and vendor branch information. This screen is a display only screen. Vendor Detail screen 1 is shown below, followed by descriptions of its fields.

```

BASE24-CORE  VENDOR DETAIL          LLLL  FIID  YY/MM/DD  hh:mm   1 OF  2

BANK — The name of the customer’s financial institution. The value in this field was retrieved during customer verification processing.

Field Length: System-protected
 Column Name: BANK.BANK_NAME

CUSTOMER ID — The unique identification number assigned to the customer. The value in this field was retrieved during customer verification processing.

Field Length: System-protected
 Column Name: CSTT.PAN

ACCT NUMBER — An application account number for this customer. An account number is displayed in this field only if one was entered and retrieved during customer verification processing. Otherwise, this field is blank.

Field Length: System-protected
Column Name: CACT.ACCT

NAME — The customer's family name or last name, followed by the customer's given name or first name, and the customer's middle initial. The name displayed in these fields was retrieved during customer verification processing.

Field Length: System-protected
Column Names: PIT.NAM_FMLY
PIT.NAM_GIVEN
PIT.NAM_M_I

Vendor Information

Vendor Name — The name of the vendor.

Field Length: System-protected
Column Name: VNDR.VEND_NAME

Vendor Number — A value generated by the system that is unique to this vendor.

Field Length: System-protected
Column Name: VNDR.VEND_NUM

Begin Date — The date on which this customer vendor will become available for use in transaction processing.

The format (for example, YYYYMMDD) in which the date in this field is displayed is provided immediately to the right of the field value on the screen.

Field Length: System-protected
Column Name: VNDR.BEG_DATE

End Date — The date on which this customer vendor will no longer be available for use in transaction processing. If blanks are displayed, no expiration date is set.

The format (for example, YYYYMMDD) in which the date in this field is displayed is provided immediately to the right of the field value on the screen.

Field Length: System-protected
Column Name: VNDR.END_DATE

Verify — A code identifying the current verification status of a vendor followed by a description of the code value. Reserved values are as follows:

- A = Awaiting ACH prenotification process to begin. This value is automatically set if the Remit Type is ACH so the ACH remittance processing software can identify this vendor as needing prenotification. No transactions can be paid to this vendor.
- F = Failed verification; no transactions can be paid to this vendor.
- I = This value is entered when the vendor row is inserted into the database. No transactions can be paid to this vendor.
- P = Pending ACH prenotification to complete; this value is used after the vendor's prenotification has been submitted for ACH processing. No transactions can be paid to this vendor.
- V = Transactions can be paid to this vendor.

User-defined codes also can be used.

The values normally used are I, F, and V. ACH processing uses the value P during prenotification processing of vendors who are paid through ACH processing. Other values may be entered; however, only the value V allows transactions to be initiated by a customer.

A description of the code displayed in the Verify field is displayed immediately to the right of the field.

Field Length: System-protected
Column Name: VNDR.VRFY

Mask Group — The mask group associated with a vendor.

Field Length: System-protected
Column Name: VNDR.MASK_GRP

Type — The type of vendor. Valid values are as follows:

P = Public
L = Limited

If any other value is displayed, the type of vendor is not known.

A public vendor is a vendor available for all customers and uses. A limited vendor is a vendor available for a limited number of customers and uses. A limited vendor is typically added when a customer wants to pay a person who is not a recognized business.

This field is provided for informational purposes only. It allows the system owner to categorize vendors for management purposes. Any customer can direct payments to any verified registered vendor, regardless of whether the vendor is designated as a public or limited vendor.

A description of the code displayed in the Type field is displayed immediately to the right of the field.

Field Length: System-protected
Column Name: VNDR.VEND_TYP

Budget Category — The budget category (for example, UTIL for utility payments or MRTG for mortgage payments) assigned to this customer vendor on behalf of the customer. A budget category is used to categorize payments made to vendors for reporting purposes. The code entered in this field must first be defined to the system by service provider or financial institution back-office personnel.

Field Length: System-protected
Column Name: VNDR.BGT_CAT

Remit: Branch Number — The branch number that identifies the branch of the financial institution where vendor remittances are directed.

Field Length: System-protected
Column Name: VNDR.REMIT_BR_NUM

Main Number — A value that identifies the main branch for the vendor.

Field Length: System-protected
Column Name: VNDR.MAIN_BR_NUM

Remit: Report Type — A code that identifies how the vendor is to be notified about the customer detail that accompanies the actual remittance. The specific values are user defined. This field is for information only.

Field Length: System-protected
Column Name: VNDR.REMIT_RPT_TYP

Remit: Contact — The name of the person responsible for remittances for the vendor.

Field Length: System-protected
Column Name: VNDR.REMIT_PERSON

Gov ID — The government identifier for this vendor. This is usually a tax ID number.

Field Length: System-protected
Column Name: VNDR.GOV_ID

Remit: Type — A code that indicates the from of payment that the vendor is to receive. Valid values are as follows:

ACH = The vendor is to receive payment in the form of Automated Clearing House (ACH).
CGP = The vendor is to receive a check that includes a group of payments.
CIT = The vendor is to receive individual checks for each payment.

Field Length: System-protected
Column Name: VNDR.REMIT_TYP

Inst ID — The ID for the bank that contains the vendor's bank account. This field is used for remittances through ACH.

Field Length: System-protected
Column Name: VNDR.INST_ID

Warning Payment Limit — A value that when exceeded by a customer payment to a vendor, causes an EMS warning message to be generated.

Field Length: System-protected
Column Name: VNDR.WRN_PMT_LMT

Account Number — The vendor's account number to be credited for payments made to the vendor. This field is used for payments made through ACH.

Field Length: System-protected
Column Name: VNDR.VEND_TYP

Account Type — A code that indicates the vendor's account number type.

Field Length: System-protected
Data Name: ATT.ALTKEY.ACCT-TYP-NAM

Vendor Branch Information

Branch Name — A free-format field that identifies the vendor branch.

Field Length: System-protected
Column Name: VNDB.VEND_BR_NAME

Branch Number — The branch number that identifies the branch of the financial institution.

Field Length: System-protected
Column Name: VNDB.BR_NUMBER

Address — The address of the branch.

Field Length: System-protected
Column Name: VNDB.ADDR_1
VNDB.ADDR_2

Mask Group — The mask group associated with the vendor.

Field Length: System-protected
Column Name: VNDB.MASK_GRP

City — The city where the financial institution branch is located.

Field Length: System-protected
Column Name: VNDB.CITY

State — The two-letter U.S. state or Canadian province abbreviation for this financial institution branch mailing address. Reserved state codes are defined in the 1988 ANSI X3.38 standard, *Identification of the States, the District of Columbia, and the Outlying and Associated Areas of the United States for Information Interchange*.

Field Length: System-protected
Column Name: VNDB.ST

Postal Code — The postal code for the mailing address of the financial institution branch.

Field Length: System-protected
Column Name: VNDB.POSTAL_CODE

County — A code that identifies the county where the financial institution branch is located.

Field Length: System-protected
Column Name: VNDB.CNTY

Country — A code that identifies the country where the financial institution branch is located.

Field Length: System-protected
Column Name: VNDB.CNTRY

Screen 2

Vendor Detail screen 2 displays vendor and vendor branch information. This screen is a display only screen. Vendor Detail screen 2 is shown below, followed by descriptions of its fields.

Vendor Information

The following five fields describe a vendor.

Vendor Specific Data Type — A value indicating the type of data to be entered. The values are user defined.

Field Length: System-protected
Column Name: VNDR.VEND_SPECIFIC_DATA_TYP

Vendor Specific Data Description — A description of the vendor-specific data required from the customer for payment.

Field Length: System-protected
Column Name: VNDR.SPECIFIC_DATA_DESC

Prenote Business Date — The date when a prenotification notice was sent for ACH transaction processing. This date is used only by vendors with a Remit type of ACH.

Field Length: System-protected
Column Name: VNDR.PRENOTE_BUS_DATE

Audio Token — The value given to a client device to retrieve data that is presented to the customer. The data retrieved is normally the vendor's name. This optional token is intended to allow a remote banking endpoint device to speak a vendor's name, but can be used by other input client devices.

The PIT-NAM-ALGO param in the Logical Network Configuration File (LCONF) must be set to the value Y before the BASE24-billpay product uses the value from this field to generate an audio token.

Field Length: System-protected
Column Name: VNDR.AUDIO_TKN

Verify Last Change — The date and time of the most recent change to the Status field. The format used to display the date in this field is shown to the right of the field.

Field Length: System-protected
Column Name: VNDR.VRFY_GMT

Vendor Branch Information

Contact — The name of the contact person at the vendor branch.

Field Length: System-protected
Column Name: VNDR.CONTACT_PERSON

Phone Number — The business telephone number at the vendor branch.

Field Length: System-protected
Column Name: VNDR.PHN

Fax Phone Number — The business telephone number of the fax machine at the vendor branch.

Field Length: System-protected
Column Name: VNDR.PHN_FAX

Communications Phone Number — The data communications telephone number for data transmission.

Field Length: System-protected
Column Name: VNDR.COMM_FAX

ACI Worldwide Inc.

Section 38

Vendor Registry

The Vendor Registry screen is a BASE24-billpay screen that allows you to select from a list of registered vendors when adding customer vendors on behalf of a customer. This screen is displayed when you press the **Shift-F4** keys on the Customer Vendor Detail screen.

You can further refine searches for registered vendors using the flags displayed to the right of the Name field on the screen. Refer to the field descriptions for details on how these fields are used when perusing registered vendors.

When you find a vendor for which a customer vendor is to be added, position the cursor on the vendor entry and press the **F1** key. The vendor information is selected and the Customer Vendor Detail screen is displayed.

Screen 1 Function Keys

The use of three function keys on Vendor Registry screen 1 differs from that specified for the standard CSR function keys explained in section 1. The use of these function keys is explained below.

The first column of information below shows the BASE24 keys. The second column describes the functions that can be accomplished with these function keys.

Key	Description
F1	Select Vendor and Return — Selects the registered vendor displayed on the same line of the screen as the cursor and returns this information to the Customer Vendor Detail screen.
F13	Display Vendor Detail Screen — Displays the Vendor Detail screen that can be used to view a list of vendors that are registered to the system and to select a vendor.

Key	Description
Shift-F7	Previous — Retrieves the previous three vendor rows from the Vendor Table (VNDR) with a Vendor Name field value less than the first vendor currently displayed on the screen for the selected key path. Select the key path by entering a full or partial value in the Name field, setting the search flags displayed to the right of the Name field as desired, and pressing the Shift-F8 keys. The search flags allow you to narrow the search for vendors to those with particular characteristics. You must select the key path at least once using the Shift-F8 keys before you can use the Shift-F7 keys. After the key path is selected, press the Shift-F7 and Shift-F8 keys to scroll through the vendors as desired. The Name field must be blank when you press the Shift-F7 keys. The search flags set when you selected the key path apply each time you press the Shift-F7 or Shift-F8 keys. For example, if the PublicOnly field was set to the value Y when you selected the key path, the previous three public vendors with a Vendor Name field value less than the first vendor currently displayed are retrieved when you press the Shift-F7 keys. Any limited vendors would be ignored. The selected key path is changed each time you enter a full or partial value in the Name field and press the Shift-F8 keys. Refer to the screen field descriptions for detailed information on the search flags used to establish the selected key path.

Key	Description
Shift-F8	Next — Retrieves the next three vendor rows from the Vendor Table (VNDR) with a Vendor Name field value greater than that of the last vendor currently displayed on the screen or greater than a full or partial value entered in the Name field for the selected key path. You select the key path by entering a full or partial value in the Name field, setting the search flags displayed to the right of the Name field as desired, and pressing the Shift-F8 keys. The search flags allow you to narrow the search for vendors to those with particular characteristics. After the key path is selected, press the Shift-F8 and Shift-F7 keys to scroll through the vendors as desired. The search flags set when you selected the key path apply each time you press the Shift-F7 or Shift-F8 keys. For example, if the PublicOnly field was set to the value Y when you selected the key path, the next three public vendors with a Vendor Name field value greater than the last vendor currently displayed are retrieved when you press the Shift-F8 keys. Any limited vendors would be ignored. The selected key path is changed each time you enter a full or partial value in the Name field and press the Shift-F8 keys. Refer to the screen field descriptions for detailed information on the search flags used to establish the selected key path.

Field Length: System-protected
Column Name: CSTT.PAN

ACCT NUMBER — An application account number for this customer. An account number is displayed in this field only if one was entered and retrieved during customer verification processing. Otherwise, this field is blank.

Field Length: System-protected
Column Name: CACT.ACCT

NAME — The customer's family name or last name, followed by the customer's given name or first name, and the customer's middle initial. The name displayed in these fields was retrieved during customer verification processing.

Field Length: System-protected
Column Names: PIT.NAM_FMLY
PIT.NAM_GIVEN
PIT.NAM_M_I

Name — The full or partial name of the vendor to use when searching for the next three registered vendors.

Field Length: 1–30 alphanumeric characters
Required: No
Default Value: No default value
Column Name: VNDR.VEND_NAME

AllBrnchs — A flag indicating whether a search includes registered vendor branch locations other than main branch. Searches always include the main branch for each registered vendor. Valid values are as follows:

Y = Yes, include registered vendor branch locations other than the main branch.
N = No, do not include registered vendor branch locations other than the main branch.

Field Length: 1 alphabetic character
Required: Yes
Default Value: N
Column Name: Not applicable

Current — A flag indicating whether to limit a search to registered vendors with an effective date range (start and end dates) that includes the current date. Valid values are as follows:

Y = Yes, limit search to registered vendors with an effective date range that includes the current date.

N = No, do not limit search to registered vendors with an effective date range that includes the current date. Include registered vendors regardless of effective date range.

Field Length: 1 alphabetic character

Required: Yes

Default Value: Y

Column Name: Not applicable

Verfd — A flag indicating whether to limit a search to registered vendors with a status of VERIFIED. Valid values are as follows:

Y = Yes, limit search to registered vendors with a status of VERIFIED.

N = No, do not limit search to registered vendors with a status of VERIFIED. Include registered vendors regardless of status.

Field Length: 1 alphabetic character

Required: Yes

Default Value: Y

Column Name: Not applicable

PublicOnly — A flag indicating whether to limit a search to registered vendors with a vendor type of PUBLIC. Valid values are as follows:

Y = Yes, limit search to registered vendors with a vendor type of PUBLIC.

N = No, do not limit search to registered vendors with a vendor type of PUBLIC. Include registered vendors regardless of vendor type.

Field Length: 1 alphabetic character

Required: Yes

Default Value: N

Column Name: Not applicable

Vendor Name — The name of the vendor.

Field Length: System-protected
Column Name: VNDR.VEND_NAME

Branch Name — A free-format field that identifies the vendor branch.

Field Length: System-protected
Column Name: VNDB.VEND_BR_NAME

Internal Number — An internal number assigned to the vendor when it was registered to the system. This number is known as the vendor number.

Field Length: System-protected
Column Name: VNDR.VEND_NUM

Remit Type — A code indicating how this registered vendor receives remittance for customer payments. Valid values include the following:

ACH = Vendor is paid electronically through automated clearing house (ACH) payments.
CGP = Vendor is paid using group-item checks.
CIT = Vendor is paid using single-item checks.

This field can display other values for user-defined remittance types.

Field Length: System-protected
Column Name: VNDR.REMIT_TYP

Address — The street or mailing address for this registered vendor's branch. Up to two lines of address information can be displayed.

Field Length: System-protected
Column Names: VNDB.ADDR_1
VNDB.ADDR_2

City — The city where this registered vendor's branch is located.

Field Length: System-protected
Column Name: VNDB.CITY

St — The two-letter U.S. state or Canadian province abbreviation for this registered vendor's branch mailing address. Reserved state codes are defined in the 1988 ANSI X3.38 standard, *Identification of the States, the District of Columbia, and the Outlying and Associated Areas of the United States for Information Interchange*.

Field Length: System-protected
Column Name: VNDB.ST

Postal Code — The postal code of this registered vendor's branch mailing address.

Field Length: System-protected
Column Name: VNDB.POSTAL_CODE

Verfd — The current status of this registered vendor. Only vendors with a status of V can be used in financial transaction processing. Valid values include the following:

- A = ACH prenotification for this vendor is required and has not yet been submitted. The status is automatically set to this value when the vendor is registered and the Remit Type is ACH. No payments can be made to this vendor.
- F = The vendor failed verification. No payments can be made to this vendor.
- I = The value assigned when the vendor is initially registered to the system. No payments can be made to this vendor.
- P = ACH prenotification for this vendor is pending. This value is applied after the vendor's prenotification has been submitted for ACH processing. No payments can be made to this vendor. A configurable number of calendar days must elapse after the prenotification is submitted before the vendor can be considered to be verified.
- V = The vendor is verified. For vendors who receive remittance by ACH payments, this value indicates that the ACH prenotification has been received. Payments can be made to this vendor.

This field can also display a user-defined value. No payments can be made to a vendor with a user-defined status.

A text description of the status is displayed to the right of the Verfd field value.

Field Length: System-protected
Column Name: VNDR.VRFY

Type — The type of vendor. Valid values are as follows:

P = Public vendor
L = Limited vendor

If any other value is displayed, the type of vendor is not known.

A public vendor is a vendor available for all customers and uses. A limited vendor is a vendor available for a limited number of customers and uses. A limited vendor is typically added when a customer wants to pay a person who is not a recognized business.

This field is provided for informational purposes only. It allows the system owner to categorize vendors for management purposes. Any customer can direct payments to any verified registered vendor, regardless of whether the vendor is designated as a public or limited vendor.

A text description of the vendor type is displayed to the right of the Type field value.

Field Length: System-protected
Column Name: VNDR.VEND_TYP

Date Range — Two dates that define when this registered vendor is available for use in transaction processing. The first date displayed indicates when the registered vendor becomes available for use in processing. The second date displayed indicates when the registered vendor is no longer available for use in processing. The current date must fall within the date range specified before a vendor can be using in transaction processing. If the second date does not appear, this registered vendor does not expire.

The format (for example, YYYYMMDD) in which the dates in this field are displayed is provided immediately below the Date Range field caption on the screen.

Field Length: System-protected
Column Names: VNDR.BEG_DATE
VNDR.END_DATE

Glossary

This glossary defines terms you may encounter when using BASE24 Remote Banking customer service representative (CSR) screens.

ACH prenotification — An optional zero-dollar entry that can be sent from an originating depository financial institution to a receiving depository financial institution to help ensure that subsequent entries to a receiver's account are posted appropriately. If the originator chooses to transmit prenotifications, it cannot initiate live entries until a specified number of calendar days after the date of the prenote. Vendors that receive electronic payment remittances cannot be considered verified until at least a configurable number of calendar days (refer to the BP-ACH-PRENOTE-DAYS param description in the ***BASE24 Logical Network Configuration File Manual***) have elapsed after the ACH prenotification has been successfully sent to the vendor.

amount owed — The total amount owed for a loan account (i.e., commercial, installment, or mortgage loan).

amount due — The amount due in the next installment for a loan account.

automated clearing house (ACH) — The Federal Reserve Bank (in the U.S.) or other organization operating as a clearing house for automated entries (electronic payments). The ACH processes entries between an originating depository financial institution and a receiving depository financial institution. Electronic payment remittance to vendors is always sent through an ACH.

available 1 — The available balance of account 1. The available balance takes into account any transactions that have been performed, including those that have not yet been posted.

available 2 — The available balance of account 2. The available balance takes into account any transactions that have been performed, including those that have not yet been posted.

available credit — The current amount of credit available for a credit or line of credit account.

customer vendor number — A one- to five-digit code used by the customer to identify the customer vendor in payment transactions. The customer vendor number is automatically assigned by the system to each of the customer's vendors. Each customer vendor number is related to an internal vendor number.

effective date range — A range of dates defined by a begin date and an end date for which a customer ID, customer application account, customer account with a vendor, financial institution identifier, or vendor can be used in financial transaction processing.

ledger 1 — The ledger balance of account 1. The ledger balance takes into account only transactions that have been posted.

ledger 2 — The ledger balance of account 2. The ledger balance takes into account only transactions that have been posted.

personal identification number (PIN) — A confidential number that provides secure access to a customer's ID. A customer can establish a different PIN for BASE24-telebanking and BASE24-billpay transactions than the one he or she uses for transactions performed with card-based BASE24 products such as BASE24-atm and BASE24-pos.

PIN — *See* personal identification number (PIN).

user-defined — Any transaction outside of the standard BASE24 Remote Banking transaction set that is defined by the user (i.e., financial institution or service provider).

vendor number — A unique one- to nine-digit code assigned by the system to identify each vendor registered to the system.

verify status — A verify status is associated with each customer ID, vendor, and each customer's account with a vendor. Only customer IDs, vendors, and accounts with vendors with a verify status of verified can be used in financial transaction processing.
